D. 1598; prob. < OF. *cricquet*, a stick which serves as a mark in the game of bowls (Roquefort); or perhaps another use of *cric**. 3, a low stool (applied to the wickets?). The word is certainly not from AS. *cricc*, *cryce*, a staff, crutch, as usually asserted.] An open-air game played with bats, ball, and wickets, long peculiar to England, but now popular throughout the British empire, and somewhat less so in the United States and elsewhere. It is played by two opposite sets or sides of players, numbering 11 players each. Two wickets of 3 stumps 27 inches high, with 2 balls each 4 inches long on top, are placed in the ground 22 yards apart. A line known as the *bowling-crease* is drawn through and parallel to the stumps, 6 feet 8 inches in length, behind which the bowler must stand. Four feet in front of this is another line, known as the *popping-crease*, of at least as great a length as the *bowling-crease*; between these two the batsman stands. After the rival sides have chosen for the choice of taking the bat or fielding, two men are sent to the wickets, bat in hand. The opposite or fielding side are all simultaneously engaged: one (the bowler) being stationed behind one wicket for the purpose of bowling his ball against the opposite wicket,

where another player (the wicket-keeper) stands ready to catch the ball should it not be batted; the other fielders are placed in different parts of the field, so as to catch or stop the ball after it has been struck by the batsman or missed by the wicket-keeper. Their positions and names are shown in the diagram. It is the object of the batsman to prevent the ball delivered by the bowler from knocking the balls off his wicket, either by merely stopping the ball with his bat or driving it away to a distant part of the field. Should the ball be driven to any distance, or not stopped by the wicket-keeper, the two batsmen run across and exchange wickets once or more. Each time this is done is counted as a "run," and is marked to the credit of the striker. If the batsman, however, allows the ball to carry away a bail or a stump, either when the ball is bowled or while he is running from wicket to wicket, if he knocks down any part of his own wicket, if any part of his person stops a ball that would otherwise have reached his wicket, or if he strikes a ball so that it is caught by one of the opposite party before it reaches the ground, he is "out"—that is, he gives up his place to one of his own side; and so the game goes on until 10 of the 11 men have played and been put out. This constitutes an "innings." The side in the field then take their turn at the bat. Generally after two innings have been played by both sides the game comes to an end, that side winning which has scored the greater number of runs. A rude form of the game is known to have been played in the thirteenth century.

From the club-ball originated . . . that pleasant and manly exercise, distinguished in modern times by the name of *cricket*. *Strutt, Sports and Pastimes*, p. 175.

Capital crime. See *capital offense*, under *capital*. — **Crime against nature**, sodomy. — **Infamous crime**. See *infamous*. — **Occult crimes**, in *Scots law*, crimes committed in secret or in privacy. = *Syn. Wrong, Sin, Crime, Vice, Iniquity, Transgression, Trespass, Delinquency*. (See *offense*.) *Wrong* is the opposite of *right*; a *wrong* is an infringement of the rights of another. *Sin* is wrong viewed as infraction of the laws of God. *Crime* is the breaking of the laws of man, specifically of laws forbidding things that are mischievous to individuals or to society, as theft, forgery, murder. *Vice* is a matter of habit in doing that which is low and degrading. *Iniquity* is great wrong. *Transgression* is an act of "stepping across," as *trespass* is an act of "passing across," the boundary of private rights, legal requirements, or general right. *Delinquency* is failure to comply with the demands of the law or of duty. See *criminal*.

< *LL. criminalis*, < *L. crimen (crimin-)*, crime: see *crime*.] *I. a.* 1. Of or pertaining to crime; relating to crime; having to do with crime or its punishment: as, a *criminal action* or case; a *criminal sentence*; a *criminal code*; *criminal law*; a *criminal lawyer*.

(b) Charges of offense against the public law of the state or nation, as distinguished from violations of municipal or local ordinances. — **Criminal contempt**. See *contempt*. — **Criminal conversation**, in law: (a) Adultery; specifically, illicit intercourse with a married woman. (b) The husband's action for damages for adultery. This action has been abolished in England by 20 and 21 Vict., lxxxv, 59, but the husband, in suing for a divorce, may claim damages from the adulterer. The action has not been abolished in the United States. — **Criminal information**, a prosecution for crime instituted by the attorney-general, in the name of the crown or the people, without requiring the sanction of a grand jury. — **Criminal law**, the law which relates to crimes and their punishment. Certain matters of a quasi-criminal character, such as indictments for nuisances, repair of roads, bridges, etc., informations, the judicial decisions of questions concerning the poor-laws, bastardy, etc., are also often treated as part of the criminal law. — **Criminal letters**, a form of criminal prosecution in Scotland, corresponding to a criminal information in England, drawn in the form of a summons, and in the supreme court running in the name of the sovereign, in the sheriff-court in that of the sheriff. — **Criminal prosecution**, the proceeding by which a person accused of a crime is brought or attempted to be brought to trial and judgment. Sometimes confined to prosecution by indictment. — **Criminal psychology**. See *psychology*, = *Syn. 2, Illegal, Criminal, Felonious, Sinful, Immoral, Wicked, Iniquitous, Depraved, Disolute, Vicious*, agree in characterizing an act as contrary to law, civil or moral. — *All except Offense and felonious* are also applicable to persons, thoughts, character, etc. *Illegal* is simply that which is not permitted by human law, or is violated by lack of compliance with legal forms: as, an *illegal election*. It suggests penalty only remotely, if at all. *Criminal* applies to transgressions of human law, with especial reference to penalty. *Felonious* applies to that which is deliberately done in the consciousness that it is a crime; its other uses are nearly or quite obsolete. *Sinful* and the words that follow it mark transgression of the divine or moral law. *Sinful* does not admit the idea that there is a moral law separate from the divine will, but is specifically expressive of "any want of conformity unto, or transgression of, the will of God" (*Shorter Catechism*, Q. 14). As such, it applies to thoughts, feelings, desires, character, while human law looks no further back of action than to intent (as, a *criminal intent*), and attempts to deal only with acts. Hence, though all men are *sinful*, all are not *criminal*. *Immoral* stands over against *sinful* in emphasizing the notion of a moral law, apart from the question of the divine will; its most frequent application is to transgressions of the moral code in regard to the indulgence of lust. *Wicked* bears the same relation to moral law that *felonious* bears to civil law; the *wicked* man does wrong wilfully and knowingly, and generally his conduct is very wrong. *Iniquitous* is wicked in relation to others' rights, and grossly unjust: as, a most *iniquitous* proceeding. *Depraved* implies a fall from a better character, not only into wickedness, but into such corruption that the person delights in evil for its own sake. *Disolute*, literally set loose or released, expresses the character, life, etc., of one who throws off all moral obligation. *Vicious*, starting with the notion of being addicted to vice, has a wide range of meaning, from cross to wicked; it is the only one of these words that may be applied to animals. See *crime*, *atrocious*, *nefarious*, and *irreligious*.

A subject may arrest for treason: the King cannot; for, if the arrest be *illegal*, the party has no remedy against the King. Quoted in *Macaulay, On Hallam's Const. Hist.*

Crocodylia (krok'ō-dil'i-ā), *n. pl.* [NL., < L. *crocodilus*, crocodile.] An order of *Reptilia*, formerly included with *Lacertilia* in *Sauria*, now separated as the highest existing

reptiles. They are lizard-like in form, with long tails and four well-developed limbs, the anterior shorter than the posterior and with five complete digits and the posterior four-toed. With a single exception, the living species have nails on the three radial and tibial digits; the feet are webbed; the nostrils are at the end of a long snout, and can be closed; and the tympanic membranes are exposed, but a cutaneous valve can be shut down over them. The skin is loricate, the dermal armor consisting of bony scutes covered with epidermal scales of corresponding form; the anus is longitudinal, as in the chelonians; the penis is single, and lodged in the cloaca; the teeth are distinctly socketed; the lungs are confined to the thorax; the heart is completely four-chambered, but the aortic arches communicate by the foramen Panizza, so that venous and arterial blood commingle outside the heart; the spinal column is well ossified; the vertebrae are mostly procelous, as in all the existing species, amphicoelus or opisthocelus in some extinct forms; the sacral vertebrae are reduced to two; the cervical bear free ribs; the ribs are bifurcated at their proximal ends; there is a series of so-called abdominal ribs disconnected from the vertebrae; and the skull is well ossified, with an inter-orbital septum, large alisphenoids and parotic processes, large fixed quadrates, ectopterygoids, completely bony tympanic cavities, rudimentary orbitosphenoids, if any, and no parietal foramen. The order ranges in time from the Oolitic strata to the present day, and contains all the huge saurians known as crocodiles, alligators, caymans, jacarés, gavials, etc. All the species are more or less aquatic, though none of the living ones is marine. The order has been divided into the five families *Alligatoridae*, *Crocodylidae*, *Gavialidae*, *Teleosauridae*, and *Belodontidae*, the last two including only extinct forms. Other names of the order are *Loricata*, *Emydosauria*, and *Hydrosauria*. Other divisions of the order than those above given are: (1) by Owen, into three suborders, *Procelia*, *Amphicelia*, and *Opisthocelia*; and (2) by Huxley, likewise into three suborders, *Parasuchia*, *Mesosuchia*, and *Eusuchia*.

The family includes two genera: *Crocodylus*, represented by the crocodile of the Nile, *C. niloticus*, and other species; and *Me-*

A game played on a lawn or a prepared piece of ground, with mallets, balls,

pegs or posts, and a number of iron hoops or arches arranged in a certain order. The order differs, but that most commonly employed in the United States is shown in the illustration. It can be played by two or more, and, in the case of several playing, they may either be divided into two parties or play each for himself. The object of the players is, starting from one end of the field, to drive the balls belonging to their own side through the hoops to the peg at the opposite end of the field, and then back again to the first peg, or winning-peg. The side doing this first wins the game. In playing, each person in turn strikes his own ball once; if his ball passes through a wicket, or hits the turning-peg, he is allowed another stroke; and if he hits one of the other balls, he may drive that away by placing his own against it and striking his own, after which he has another stroke.

2. In the game of croquet, the act of a player, upon hitting a second ball with his own, or driving that one away by a stroke on his own, which he holds firmly with his foot, after he has placed the two in contact.

crow² (krō), *n.* [*< ME. crow*, *craw*, *crowe*, *crāwe*, < *AS. crāwe* = *OS. krāia* = *D. kraai* = *MLG. krā*, *krāge* = *OHG. chrāja*, *chrāwa*, *chrāu*, *chrā*, *MHG. krā*, *kreje*, *G. krāhe*, a crow, a raven; from the verb, *AS. crāwan*, etc., *crow* (orig. in a general sense). Cf. *E. dial. crake*, a crow, *leel. krāka*, a crow: see *crake*², *crak*, etc.] 1. A general name including most birds of the genus *Corvus* and of the family *Corvidæ*; especially, one of the *Corvinæ*. See these three words. The larger kinds of crows are called *ravens*, especially those which have the throat-feathers lengthened, lanceolate, and discrete. The term, used absolutely, means in Great Britain the carrion-crow. *Corvus corone*, and in the United States the common American crow, *C. americanus*. The two species are so similar in all respects that they are only distinguished by slight technical characters. The plumage is jet-black, with a purplish and violet gloss or sheen, especially on the back, wings, and tail; the bill and feet are ebony-black; the base of the upper mandible is covered for a long distance with a bundle of antrorse bristly feathers, filling each nasal fossa and hiding the nostrils. The eyes are bright and

Carrion-crow (*Corvus corone*).

intelligent, of a hazel-brown color. The feet are stout, with strong curved claws and scaly tarsi and toes. The tail is of moderate length, a little rounded or fish-shaped, of 12 broad plane feathers. The wings are lengthened and pointed, with 10 primaries, and when folded their tips fall nearly opposite the end of the tail. The length of these crows is 18 or 20 inches. Crows are among the most omnivorous of birds, eating almost everything from carrion to fruits. Some species, hence called *fish-crows*, are fond of fish and shell-fish, as mollusks and crustaceans. Crows usually nest in trees, where they build large bulky nests of sticks, and lay greenish eggs heavily spotted with dark colors, generally to the number of 4, 5, or 6. They are noted for their sagacity, and in populous countries become extremely wary and knowing birds, their instinct of self-preservation being developed to the highest degree by the incessant persecution to which they are subjected.

Opinions differ as to their being on the whole most beneficial or most injurious to the agriculturist, but they are generally classed as "vermin," and in some places a legal price is set upon their heads. Crows are eminently sociable birds, and however widely they may be dispersed in pairs in the breeding season, they flock at other times; and in winter, in many places in the United States, vast bands numbering hundreds of thousands assemble nightly to roost together, often flying 20 to 40 miles back to these *crow-roosts* at night after foraging over the country for food during the earlier hours of the day. The common American fish-crow is *C. ossifragus* or *C. maritimus*, an undersized species inhabiting southerly parts of the United States, especially coastward, and feeding much on shell-fish. The northwestern fish-crow is *C. caurinus*, a similar though distinct species. The white-necked crow or raven is *C. cryptoleucus*, of western parts of the United States, in which the plumage of the neck beneath the black surface is snowy-white. A number of small crows resembling the fish-crow inhabit the West Indies, as *C. jamaicensis*. In some of these the face is partially naked, a character which is also conspicuous in the European rook, a kind of crow, *C. frugilegus*. The European daw, *C. monedula*, is another kind of crow. See also phrases below.

eastern United States: so called from its large size and dark color, which give it somewhat the appearance of a crow. The male is about 13 inches long and 17½ inches in extent of wings. The plumage is richly iridescent, with green, blue, violet, purple, and bronzy tints; the bill and feet are ebony-black; the iris is straw-yellow; the tail is somewhat boat-shaped. The female is blackish and quite lustrous, in this differing from some related species, and also a little smaller than the male. A variety has a perfectly brassy back and steel-blue head; it is sometimes distinguished as the *bronzed crow-blackbird*. The name is extended to the other species of the same genus. *C. major* is a larger species of the southern United States, known as the *boat-tailed crow-blackbird* or *grackle*, and locally called *jackdaw*. The tail is much carinated, and the disproportion in size of the sexes is very great, the female being only about 13 inches long, while the male is 16½ to 17; the peculiar development of the tail is lacking in the female, and the color is plain grayish-brown, the male being richly iridescent black. A still larger species, the *fan-tailed crow-blackbird*, *C. macurus*, also called *Texas grackle*, inhabits the Gulf States and Mexico; the male attains a length of 18 inches, while the female is much smaller. All these birds are gregarious, nest in trees and bushes, sometimes in holes, and lay 5 or 6 greenish eggs, clouded, veined, and scratched with various dark colors.

2. An ornament or covering for the head worn as a symbol of sovereignty. Crowns were of very varied forms till heralds devised a regular series to mark the grades of rank, from the imperial crown to the baron's coronet. (See *coronet* 1, 2.) The crown of England is a gold circle, adorned with pearls and precious stones, from which rise alternately four Maltese crosses and four fleurs-de-lis.

From the tops of the crosses spring imperial arches, closing under a mound and cross. Within the crown is a crimson velvet cap with an ermine border. The crown of Charlemagne, which is preserved in the imperial treasury of Vienna, is composed of eight plates of gold, four large and four small, connected by hinges. The large plates are studded with precious stones, the front one being surmounted with a cross; the smaller ones, placed alternately

with these, are ornamented with enamels representing Solomon, David, Hezekiah, and Isaiah, and Christ seated between two flaming seraphim. The Austrian crown is a sort of cleft tiara, having in the middle a semicircle of gold supporting a mound and cross; the tiara rests on a circle with pendants like those of a mitre.

The Russian crown is a modified form of the same imperial crown. The royal crown of France is a circle ornamented with eight fleurs-de-lis, from which rise as many quarter-circles closing under a double fleur-de-lis.

The triple crown of the popes is more commonly called the tiara. (See *diadem*.) In heraldry the crown is used as a bearing in many forms. When a coronet or open crown is used to alter or differentiate a bearing, whether on the escutcheon or as a crest or supporter, it is not blazoned by itself, but the bearing is said to be *crowned*; when it is placed around the neck of an animal, the animal is said to be *gorged*.

to the crown or sovereign. They are placed under commissioners, and the revenue derived from them becomes part of the consolidated fund.

The additional allowances thus granted by Parliament to the Prince and Princess of Wales, and other members of the Royal Family, amount to an annual charge of £156,000; and when it is remembered that the Crown lands alone surrendered to Parliament yield an annual income of nearly £380,000, it will be evident that the charge upon the nation for the support of the dignity of Royalty is by no means extravagant, as interested persons would sometimes have us believe.

crusade¹ (krö-sād'), *n.* [Early mod. E. also *crusado*, *croisade*, *croisado*, *croysado*, earlier *cruciade*, late ME. *cruciade*, *cruciati* (being variously accom. to the ML., Sp., or F.); = F. *croisade* (after Pr.), OF. *croisée* (also in another form *croisierie*) = Pr. *croisada*, *crozada* = Sp. Pg. *crusada* = It. *crociata*, < ML. *cruciata*, a crusade, lit. The earlier ME. word for 'crusade' was *croisery*: see *croisery*.] 1. A military expedition under the banner of the cross; specifically, one of the medieval expeditions undertaken by the Christians of Europe for the recovery of the Holy Land from the Mohammedans. The crusading spirit was aroused throughout Europe in 1095 by the preaching of the monk Peter the Hermit, who with Walter the Penniless set out in 1096 with an immense rabble, who were nearly all destroyed on the way. The first real crusade, under Godfrey of Bouillon, 1096-9, resulted in the capture of Jerusalem and the establishment of a Christian kingdom in the Holy Land; the second, 1147, preached by St. Bernard, was unsuccessful; the third, 1189-92, led by the prince Frederick Barbarossa of Germany, Richard the Lion-hearted of England, and Philip Augustus of France, failed to recover Jerusalem, which the Mussulmans had taken in 1187; the fourth, 1202-4, ended in the establishment of a Latin empire in Constantinople, under Count Baldwin of Flanders, one of its leaders; the fifth, 1228-9, under the emperor Frederick II., the sixth, 1248-50, under St. Louis (Louis IX. of France), and the seventh and last, 1270-71, also under St. Louis, were all unsuccessful. There were other expeditions called crusades, including one of boys, 1212, "the children's crusade," in which many thousands perished by shipwreck or were enslaved. The cost of the crusades and the loss of life in them were enormous, but they stimulated commerce and the interchange of ideas between the West and the East. The expeditions against the Albigenses under papal auspices, 1207-29, were also called crusades.

For the crusade preached through western Christendom, A. D. 1188, it was ordained that the English should wear a white cross; the French a red; the Flemish a green one. Quoted in *Rock's Church of our Fathers*, III. i. 446, note.

The *Crusades*, with all their drawbacks, were the trial feat of a new world, a reconstituted Christendom, striving after a better ideal than that of piracy and fraternal bloodshed. *Stubbs*, Medieval and Modern Hist., p. 222.

crusader (krö-sā'dēr), *n.* [Cf. equiv. *croisier*.] A person engaged in a crusade. The crusaders of the middle ages bore as a badge on the breast or the shoulder a representation of the cross, the assumption of which, called "taking the cross," constituted a binding engagement and released them from all other obligations.

If other pilgrims had their peculiar marks, so too had the crusader. For a token of that vow which he had pledged, he always wore a cross sewed to his dress, until he went to, and all the while he stayed in, the Holy Land. *Rock*, Church of our Fathers, III. i. 446.

With all their faults these nobles (of Cyprus) were bona fide *Crusaders*; men who, like the first champions, were ready to cast in their lot in a Promised Land, and not, like the later adventurers, anxious merely to get all they could out of it, to make their fortunes. *Stubbs*, Medieval and Modern Hist., p. 200.

Cf. *L. crustata*, shell-fish: see *crustate*.] 1. A class of *Arthropoda*; one of the prime divisions of articulated animals with articulated legs, as

distinguished from *Insecta*, *Myriapoda*, and *Arachnida* respectively. They are mostly aquatic arthropods with (generally) two pairs of antennae and numerous thoracic as well as (usually) abdominal articulated appendages, and breathing by means of branchiae. The body is covered with a hard chitinous test or crust, whence the name. It is segmented into head, thorax, and abdomen, the two former of which are more or less completely united into a cephalothorax, shielded with a continuous carapace; the abdomen is usually segmented and mobile, presenting the appearance of a tail. A typical segment or somite of the body consists, at least theoretically, of a dorsal portion or tergite of two pieces, a ventral portion or sternite, also of two pieces, an epimeron on each side above, and an episternum on each side below. The shell sends inward sundry hard processes or partitions called apodemes. The typical number of segments in the higher *Crustacea* is 21, actually or theoretically. The crustaceans shed their shells (exoskeletons), in some cases with extraordinary frequency, and they possess great reparatory powers in the reproduction of lost parts. Most of them pass through several larval stages, the best-marked of which are those of the forms called the *nauplius*, *zoea*, and *megalopa*. The crustaceans include all kinds of crabs and lobsters, shrimps, prawns, crawfish, etc., among the higher forms; and among the lower, a great variety of creatures known as sand-hoppers, beach-fleas, wood-lice, fish-lice, barnacles, etc. Leading types, in more technical terms, are the thoracostracan, podophthalmic, or stalk-eyed crustaceans, as crabs and crawfish; the edriophthalmous or sessile-eyed crustaceans, as lepidopods, amphipods, and isopods (all the foregoing being sometimes grouped together as malacostracan crustaceans); the entomostracous crustaceans, as the copepods, ostracodes, cladocerans, phyllopods, etc., the trilobites and their related forms being often brought under this division; the epizoans, ichthyophthirians, or fish-lice; and finally, the cirripeds. Great as is the difference between extremes in any of these forms, they are closely related by connecting forms, and naturalists are by no means agreed upon the formal division of the class. The older divisions which have been made are now mostly superseded, and even the modern ones are seldom exactly conforming. A series of subclasses sometimes now adopted is: (1) *Cirripedia* or *Pectostraca*, with three or four orders; (2) *Ephyra* or *Ichthyophthiria*; (3) *Entomostraca*, with such orders as *Copepoda*, *Ostracoda*, *Cladocera*, *Phyllopoda*, *Xiphura*, *Trilobita*, *Euryptera*; (4) *Edriophthalma*, with *Leptopoda*, *Amphipoda*, and *Isopoda*; (5) *Podophthalma*, with *Stomatopoda* and *Decapoda*; to which some add (6) *Podosomata*, often considered to be arachnidans. The fourth and fifth of these are often united as one subclass, *Malacostraca*. The trilobites with the eurypterygians and king-crabs sometimes constitute one prime division called *Gigantostomata*. Haeckel uses *Caridea* as a substitute for *Crustacea*.

[cap.] The Southern Cross, the most celebrated constellation of the southern heavens. It was erected into a constellation by Royer in 1679, but was often spoken of as a cross before; there even seems to be an obscure allusion to it in Dante. It is situated south of the western part of Centaurus, east of the keel of Argus. It is a small constellation of four chief stars, arranged in the form of a cross. Its brightest star, the southernmost, is of about the first magnitude; the eastern, half a magnitude fainter; the northern, of about the second magnitude; and the western, of the third magnitude and faint. The constellation owes its striking effect to its compression, for it subtends only about 6° from north to south and still less from east to west. It looks more like a kite than a cross. All four stars are white except the northernmost, which is of a clear orange-color. It contains a fifth star of the fourth magnitude, which is very red.

The name remains in general use, and the group is further characterized by the absence of a seed containing an embryo. The organs and methods of reproduction vary greatly, in some cases being closely analogous to those of phanogamous plants, while in the lowest no sexual character whatever is distinguishable. As improvements in the microscope have made possible a more thorough study of the *Cryptogamia*, their classification has been gradually modified and perfected, but it still remains to some extent unsettled, especially in regard to the lower groups. A division into *higher* and *lower cryptogams* is often made, corresponding to the *aethogamous* and *amphigamous* classes of De Candolle's arrangement, otherwise known as *acrogens* and *thallogens*. The first group are either vascular (including the *Filices*, *Equisetaceæ*, and their allies, also called *Pteridophyta*) or cellular (including the *Hepaticeæ* and *Musci*, unitedly called *Bryophyta*). The lower cryptogams are wholly cellular, and are variously subdivided, the usual division being into

crystal (kris'tal), n. and a. [Formerly *crystal*, also often erroneously *crystal*, *crystal*, etc., now acc. to L. spelling; < ME. *crystal*, *crystal*, < OF. *crystal*, F. *crystal* = Pr. Sp. *crystal* = Pg. *crystal* = It. *cristallo* = AS. *cristalla* = D. *kristal* = OHG. *chrestalla*, MHG. *kristalle*, fem., *kristall*, masc., G. *krystall*, *kristall*, masc., = Dan. *krystal* = Sw. *kristall*, < L. *crystallum*, ice, crystal, < Gr. κρύσταλλος, clear ice, ice, also rock-crystal (so called from its resemblance to ice, of which it was supposed to be a modified and permanent form); < κρύσταλλον, freeze, < κρύος, cold, frost.] 1. n. In chem. and mineral, a body which, by the operation of molecular affinity, has assumed a definite internal structure with the form of a regular solid inclosed by a certain number of plane surfaces arranged according to the laws of symmetry. The internal structure is exhibited in the cleavage, in the behavior of sections in polarized light, etc. The external form is discussed under *crystallography* (which see). Crystals are obtained in the laboratory either by fusing substances by heat and allowing them gradually to cool, or by dissolving them in a fluid and then abstracting the latter by slow evaporation; also by the direct condensation of a vapor produced by sublimation, as in the case of arsenious oxide, in the same way that snow-crystals are formed directly from water-vapor in the upper atmosphere. The name was first applied to the transparent varieties of quartz, specifically called *rock-crystals*.

There was a sea of glass like unto crystal. Rev. iv. 6.

The term *crystal* is now applied to all symmetrical solid shapes assumed spontaneously by lifeless matter.

Huxley, *Physiography*, p. 59.

2. Glass. (a) Glass of a high degree of transparency and freedom from color. It is heavier than ordinary glass, because containing much oxide of lead. (b) Fine glass used for table-vessels or other table-service, or for ornamental pieces. The term is sometimes used as synonymous with *cut glass*. (c) The glass cover of a watch-case.

This is due to the extension of certain faces at the expense of others during the growth of the crystal, but in general without altering the interfacial angles. In fact, all crystals are more or less distorted.—**Embedded crystals**, crystals enveloped within the mass of a rock or other mineral.—**Geniculated crystal**, a twin or compound crystal, consisting of two or more parts bent at an angle to one another, as is common with the mineral rutile.—**Iceland crystal**, a variety of calcite or crystallized calcium carbonate brought from Iceland, remarkable for its transparency.—**Implanted crystals**, crystals which pro-

(b) In *optics*. See *refraction*.—**Pink crystals**. Same as *pink salts*. See *salts*.—**Plastic crystal**, a trade-name for a kind of Portland cement composed of silica and alumina and traces of oxide of iron, lime, magnesia, and some alkalis.—**Positive crystal**, in *optics*. See *refraction*.—**Pseudomorphous crystal**. See *pseudomorph*.—**Replaced crystal**, a crystal having one plane or more in the place of each of its edges or angles.—**Rock-crystal**, or *mountain crystal*, a general name for all the transparent crystals of quartz, particularly of limpid or colorless quartz. From their brilliancy such crystals are often popularly called *diamonds*, as *Lake George diamonds*, *Bristol diamonds*, etc.—**Twin crystal**. See *twin*.

The process by which the molecules of a substance which is in the state of a liquid (or vapor) unite in regular (crystalline) form when it solidifies by cooling or evaporation. If the process is slow and undisturbed, the molecules assume a regular arrangement, each substance taking a determinate form according to its natural laws; but if the process is rapid or disturbed, the external form may be more or less irregular. An amorphous solid body may also undergo partial crystallization by a molecular rearrangement, giving it a more or less complete crystalline structure, as, for instance, in the iron of a railroad-bridge after long use. See *crystallography*.

2. The mass or body formed by the process of crystallizing.

Also spelled *crystallisation*.

Alternate crystallization, a species of crystallization which takes place when several crystallizable substances having little affinity for one another are present in the same solution. The substance which is largest in quantity and least soluble crystallizes first, in part; the least soluble substance next in quantity then begins to crystallize; and thus different substances, as salts, are often deposited in successive layers from the same solution.—**Water of crystallization**, water which is held by certain salts as a part of their crystalline structure, but is not inherent in the molecule. Thus, common sodium carbonate, when it crystallizes from a solution, contains for each molecule of sodium carbonate ten molecules of water. This is so weakly held that it escapes as vapor in dry air at ordinary temperatures. The crystalline form of the salt often depends on the number of molecules of water which the crystals contain. Water of crystallization differs from combined water in that it does not belong to the molecular structure, but only to the crystalline structure, of the substance.

The science of the process of crystallization, and of the forms and structure of crystals. The following are the generally adopted systems of crystallography based upon the degree of symmetry which characterizes the different forms, but defined according to the length and inclination of the assumed axes: (a) the *isometric*, characterized by three rectangular axes, all of equal length; (b) the *tetragonal*, by three rectangular axes, two of which are of equal length; (c) the *hexagonal* (and *rhombic*), by four axes, three of equal length, in the same plane, and inclined to one another at an angle of 60°, the fourth of different length, and at right angles to the plane of the other three; (d) the *orthorhombic*, by three rectangular axes of unequal length; (e) the *monoclinic*, by three axes, two at right angles to each other, and the third perpendicular to one and oblique to the other; and (f) the *triclinic*, by three axes, all oblique to one another. The study of crystallography is of great importance to the chemist and mineralogist, as the nature of many substances may be ascertained from an inspection of the forms of their crystals.

[NL., *< Gr. κτενίδιον*, dim. of *κτερίς* (*κτεν-*), a comb.] One of the gill-combs, gill-plumes, or primitive branchial organs of mollusks; the respiratory organ of a mollusk in a generalized stage of development. A ctenidium is always a gill, but a gill may not be a ctenidium, since a respiratory function may be assumed by some part of the body which is not ctenidial in a morphological sense.

On either side of the neck there may be seen an oval yellowish body, the rudimentary gills or *ctenidia*. *Trans. Roy. Soc. of Edinburgh, XXXII. 804.*

Cteniza (te-nī'zā), *n.* [NL., irreg. *< Gr. κτενίζευ*, comb, *< κτερίς* (*κτεν-*), a comb.] A genus of spiders, of the family *Mygalidae*. The species are of large size, and are among those known as trap-door spiders, such as *C. cemenaria* of Europe and *C. californica* of the western United States. They are remarkable for forming in the ground a habitation consisting of a long cylindrical tube, protected at the top by a circular door, which is connected to the tube by a hinge. The lid is made of alternate layers of earth and web, and when shut can scarcely be distinguished from the surrounding soil.

ctenobranch (ten'ō-brang-k), *a. and n.* [*< Ctenobranchia*.] 1. *a.* Having a pectinate gill; ctenobranchiate.

II. *n.* A ctenobranchiate gastropod; one of the *Ctenobranchiata*.

Are we to accept this view of Lankester and to consider the gill as we find it in most *ctenobranchs* derived from a ctenidium by modification, or shall we regard the common form of ctenobranch gill as the most primitive?

Biol. Lab. of Johns Hopkins, III. 44.

Ctenobranchia (ten'ō-brang'ki-ā), *n. pl.* [NL., *< Gr. κτερίς* (*κτεν-*), a comb, + *βράγχια*, gills.] Same as *Ctenobranchiata*.

Ctenobranchiata (ten'ō-brang'ki-ā'tā), *n. pl.* [NL., neut. pl. of *ctenobranchiatus*; see *ctenobranchiate*.] In Van der Hoeven's classification, the tenth family of mollusks, characterized by spiral shells, and by having the branchial cavity (in which there are sometimes three branchia, sometimes two, and sometimes only one) composed of numerous leaves like the teeth of a comb, and contained in the last turn of the shell. They have two tentacles and two eyes, the latter often pediculate. The sexes are separate, and the external organs of generation are distinct. There are both fresh and salt-water species. The whelk is the best-known member of the family. The *Ctenobranchiata* are now regarded as a suborder of prosobranchiate gastropods, containing upward of 20 families. Also called *Pectinibranchiata* (which see).

ctenobranchiate (ten'ō-brang'ki-āt), *a.* [*< NL. ctenobranchiatus*; as *Ctenobranchia + -atus*; see *-ate*.] Having pectinate gills; specifically, pertaining to the *Ctenobranchiata*.

ctenocyst (ten'ō-sist), *n.* [NL., *< Gr. κτερίς* (*κτεν-*), comb, + *κύστις*, a bladder (cyst).] The characteristic sense-organ of the ctenophorans, regarded as probably an auditory capsule; a large vesicle situated at the aboral pole, with a clear fluid and vibratile otoliths. See *Ctenophora*.

ctenodactyl, ctenodactyle (ten'ō-dak'til), *n.* An animal of the genus *Ctenodactylus*.

Ctenodactylinae (ten'ō-dak'ti-lī'nē), *n. pl.* [NL., *< Ctenodactylus + -inae*.] A subfamily of hystricomorphic rodents, of the family *Octodontidae*; the comb-rats, so called from the comb-like fringing of the toes. They are exceptional among the hystricine animals in not having four back teeth above and below on each side. In *Ctenodactylus* the molars are three in each half jaw above and below, there being no premolars; and in *Pectinator*, the only other genus, these teeth are minute. The *Ctenodactylinae* have some relationship with the jerboas, though totally different in appearance. They are confined to Africa.

Ctenodactylus (ten'ō-dak'ti-lus), *n.* [NL., *< Gr. κτερίς* (*κτεν-*), a comb, + *δάκτυλος*, a finger or

Comb-rat (*Ctenodactylus masoni*).

(b) The inner bone of the forearm; the ulna. —2. A linear unit derived from the length of the forearm. The natural cubit used for measuring cloth was probably originally the length from the end of the thumb-nail to the elbow, though no cubit so short is known. The royal Egyptian cubit is, of all units of measure or weight, that one whose use can be traced back in history the furthest; for it was employed in the construction of the pyramids of Gizeh, perhaps 3500 B. C. From a number of Egyptian measuring-sticks found in the tombs, this cubit is ascertained to be equal to 20.64 English inches, or 524 millimeters. It was divided into seven palms, instead of six as the ordinary cubit was; and this was probably owing to measurements along walls with the forearm having been made by placing the hand behind the elbow and leaving it on the wall until the arm was laid down again. The Egyptian and Roman are the only ancient cubits of importance whose lengths are undisputed. The Roman cubit was $\frac{1}{2}$ Roman feet, or 17.4 English inches. Two cubits are mentioned in the Bible, for Ezekiel speaks of a cubit which is a cubit and a hand-breadth. The shorter of these cubits was probably that which in Deuteronomy is called the cubit of a man; the longer one, that which in Chronicles is called the cubit after the first measure—that is, the most ancient cubit. Julian of Ascalon speaks of two cubits in the ratio of 25 to 26. But we have no accurate knowledge of the lengths of the Hebrew cubits, since the cubit of the temple is estimated variously by high authorities, as from 19 to 26 inches. There are many cubits, ancient and modern, of widely different values.

And gee schulle undirtonde, that the Cros of oure Lord was eyght *Cubytes* long, and the overthwart piece was of lengthe *ten Cubytes* and an half. *Mandeville, Travels, p. 12.*

In the thirteenth century it consisted of a round, slightly hollowed in the form of a cup, and held over the hauberk or brigandine by a strap passing round the elbow-joint; later it became more conical, and in the fourteenth century another plate was added, covering the side of the elbow-joint. When the complete brassart was introduced, toward the close of the fourteenth century, the cubitière formed a part of this, and was regularly articulated; but the old cup-shaped form or some modification of it was retained by those who could not afford the expense of the brassart of plate. A similar imitation occurs also in *coo*, *cook*², *cock*¹, *caw*, etc. (see these words). The forms, being imitative, do not conform closely to the rules of historical development. In early superstitions the cuckoo was regarded as of evil omen, and enters into various imprecations and proverbs as an embodiment of the devil. It was also a term of reproach or contempt equivalent to *fool* (cf. *gowk*, in similar use), and with reference to its habit of laying its eggs in other birds' nests is the subject of endless allusion in early literature: see *cuckold*¹.] 1. A bird of the family *Cuculidae*, and especially of the subfamily *Cuculinae* or genus *Cuculus*: so called from its characteristic note. bill, and ashy plumage varied with black and white. It is notorious for its parasitism, having the habit common to many birds of the family of depositing its eggs in the nests of other birds, chiefly smaller than itself, and causing its young to be reared by the foster-parents—a condition generally entailing the destruction of their own progeny. The remarkable cries which have given the bird imitative names in many languages are the love-notes, uttered only during the mating season. The species of cuckoos are very numerous, and are found in most parts of the world; they are not all parasitic. There are several subfamilies of *Cuculidae*, and many genera. (See *Cuculidae*.) The American or tree-cuckoos are arboreal, not parasitic, and are confined to America; they are also called hook-billed cuckoos, a term not of special pertinence. The ground-cuckoos are American birds of terrestrial habits. The crested cuckoos are old-world forms, as are also the coucals, lark-heeled or spur-heeled cuckoos, also called pheasant-cuckoos.

2. (a) A distinct terminal part of a sleeve at the wrist, intended for embellishment. The cuff was made originally by turning back the sleeve itself and showing either the same material as that of the sleeve or a different material used as a lining. In the fifteenth century a prominent part of the dress was the large cuff, which could be turned down so as to cover the hand to the finger-tips, and when turned back reached nearly to the elbow. In modern times the coat-sleeve has been sometimes made with a cuff which can be turned down over the hand, though not intended to be so used, and sometimes with a semblance of a cuff, indicated by braid and buttons, or by a facing of velvet or other material, or merely by a line or lines of stitching around the sleeve. (b) A band of linen, lace, or the like, taking the place of, and covering a part of the sleeve in the same manner as, the turned-up cuff. In the seventeenth century such cuffs, worn by ladies, were often extremely rich, of expensive lace, and reached nearly to the elbow. Plain linen cuffs were also worn about 1640, and were especially affected by the Puritans in England. When the plain linen wristband worn attached to the shirt by men first came into use, in the early part of the nineteenth century, it was commonly turned back over the sleeve, and was a true cuff. (c) In recent times, a separate band of linen or other material worn about the wrist and appearing below the end of the sleeve. As worn by men, it is buttoned to the wristband of the shirt.—3. Gelatin culture, a growth of bacteria in a medium made of the consistence of jelly by means of gelatin.—**Pure culture**, in *bacteriology*, a growth of one kind of bacteria free from admixture of other varieties.—**Solid culture**, a culture of bacteria, etc., for which the medium is a solid at ordinary temperatures, usually gelatin or a preparation, such as agar-agar, made from algae.—**Test-tube culture**, a growth of bacteria in a test-tube.—Syn. 4-6. *Refinement*, *Cultivation*, *Culture*. Each of these words may represent a process or the result of that process. Only *refinement* can, when unqualified, represent a process or result carried too far. *Refinement* is properly most negative, representing a freeing from what is gross, coarse, rude, and the like, or a bringing of one out of a similar condition in which he is supposed to have been at the start. *Cultivation* and *culture* represent the person or the better part of him as made to grow by long-continued and thorough work. *Refinement* and *cultivation*, as thus representing the more negative and the more positive aspects of the improvement of man, were much more common until within thirty years; since then *culture* has largely supplanted *cultivation*: this change, coming when great attention was concentrating about the subject of the development of all the departments of the nature of man, produced a great enlargement of the definition of *culture*, for a time the improvement and gratification of taste being magnified in undue proportion by some, and by others the mere acquisition of knowledge. The word is now applied to the improvement of the whole man, bodily, mentally, and spiritually, although bodily training is not prominent unless specially mentioned; the moral and the spiritual are jealously included. *Culture* may be used of the state of society as well as of the man; *refinement* and *cultivation* refer primarily to the state of the individual. As referring to either, *culture* in its broadest sense may be called the highest phase of civilization.

What do we mean by this fine word *Culture*, so much in vogue at present? What the Greeks naturally expressed by their *paideia*, the Romans by *humanitas*, we less happily try to express by the more artificial word *Culture*. . . . When applied to the human being, it means, I suppose, the "educing or drawing forth [of] all that is potentially in a man," the training [of] all the energies and capacities of his being to the highest pitch, and directing them to their true ends. *Shairp*, Culture and Religion, i.

=Syn. 4. *Cunning*, *Artful*, *Sly*, *Subtle*, *Shrewd*, *Tricky*, *Adroit*, *Wily*, *Crafty*, *Intriguing*, *sharp*, *foxy*. All these words suggest something underhand or deceptive. *Cunning*, literally knowing, and especially knowing how, now implies a disposition to compass one's ends by concealment; hence we speak of a fox-like *cunning*. *Artful* indicates greater ingenuity and ability, the latter, however, being of a low kind. *Sly* is the same as *cunning*, except that it is more vulgar and implies less ability. ("A col-fox, full of sleigh iniquity." Chaucer, *Nun's Priest's Tale*, l. 395.) ("Envy works in a *sly*, imperceptible manner." Watts.)

Subtle implies concealment, like *cunning*, but also a marked ability and the power to work out one's plans without being suspected; hence, while *cunning* is applicable to brutes, *subtle* is too high a word for that, except by figurative use. The rabbit is *cunning* enough to hide from the dog; *Mephistopheles* is *subtle*. (For the favorable meanings of *subtle*, see *astute*. For the good senses of *shrewd*, see *acute*.)

In its unfavorable aspects *shrewd* implies a penetration and judgment that are somewhat narrow and worldly-wise, too much so to deserve the name of sagacity or wisdom. (See *astute*.) *Tricky* is especially a word of action; it expresses the character and conduct of one who gets the confidence of others only to abuse it by acts of selfishness, especially cheating. *Adroit*, in a bad sense, expresses a ready and skilful use of trickery, or facility in performing and escaping detection of reprehensible acts. (See *adroit*.) *Wily* is appropriate where a person is viewed as an opponent in real or figurative warfare, against whom wiles or stratagems are employed: a *wily* adversary is one who is full of such devices; a *wily* politician is one who is notably given to advancing party interests by leading the opposite side to commit blunders, etc. A *crafty* man has less ability than a *subtle* man, and works more by deception or knavery than the *shrewd* man; he is more active than the *cunning* man, and more stealthily active than the *sly* man; he is on the moral level of the *trickish* man. *Intriguing* is applied where the plots are secret arrangements made with others, perhaps against a third party, and especially of a complicated character.

Controller of the *Currency*. See *controller*, 2.—

Decimal *currency*, a system of money the divisions or denominations of which proceed from its lowest unit of reckoning by ten or its multiples, or aliquot parts thereof, as the cent, dime, dollar, quarter-dollar, etc., of the United States and Canada.—Fractional *currency*, coins or paper money of a smaller denomination than the monetary unit; in the United States, half-dollars, quarters, dimes, and 5-cent, 3-cent, 2-cent, and 1-cent pieces. Fractional *currency* in paper has been largely used in several European countries, and is a part of the monetary system of Japan. Fractional notes have been used at different times in the United States, especially during the financial panic of 1837–38, and during and after the civil war of 1861–65, when specie was withdrawn from circulation. The former received the name of *shinplasters*. (See *shinplaster*.) On March 17th, 1862, Congress authorized an issue of circulating notes called *postage currency*, imitating in style the stamps that had previously been used at great inconvenience, in denominations of 5, 10, 25, and 50 cents. These were superseded by the fractional *currency* authorized March 3d, 1863, in denominations of 3, 5, 15, 25, and 50 cents. The issue of fractional notes was suspended by act of April 17th, 1876; but its renewal has since been proposed for convenience in remittance of small sums.—Metallic *currency*, the gold, silver, and copper in circulation as money.—National *currency* Act, statutes of the United States of 1863, 1864, and 1865, providing for a general and uniform bank-note *currency* guaranteed by the United States and secured by national bonds deposited in the Treasury.—Paper *currency*, notes issued by a government or by banks as a substitute for money, or as a representative of money. The paper *currency* of the United States is of three kinds: (1) notes issued by the government and called *demand treasury notes*, or more generally *legal-tenders*; (2) notes issued by national banks; and (3) certificates issued by the government upon either gold or silver. The smallest denomination of the first is \$20, and of the last \$1.—Postage *currency*. See *fractional currency*, above.—The *currency* principle, a phrase first employed in English banking to express the mode of issuing notes by the Bank of England. An amount fixed by law is issued, based on an equal amount of securities, mostly government obligations; and all notes issued in excess of that amount, which is called "the fixed issue," are based on an equal amount of specie.

cursive (kér'siv), *a. and n.* [= *F. cursif* = *Sp. Pg. cursivo* = *It. corsivo*, *< ML. cursivus*, running (of writing), *< L. cursus*, a running, a course, *< currere*, run: see *current*.] I. *a.* Running; flowing, as writing or manuscript in which the letters are joined one to another, and are formed rapidly without raising the pen, pencil, or stylus; specifically, in *paleography*, modified from the capital or uncial form, so as to assume a form analogous to that used in modern running hand: as, the *cursive style*; *cursive letters*; *cursive manuscripts*. Greek cursive writing is found in papyri dating back to about 160 B.C., at first very similar to the lapidary and uncial characters of the same period, but gradually becoming more rounded in form and negligent in style. The epithet *cursive* is, however, most frequently applied to the later cursive or minuscule writing from the ninth century on. (See *minuscule*.) The beginning of a Latin cursive character is seen in some waxed tablets discovered in 1875 in the house of L. Cæcilius Jucundus at Pompeii. Forms similar to these also occur in the dipinti and graffiti (characters painted on or incised in walls, earthenware, etc.) of the same place or period. The ancient Latin cursive character known to us in manuscripts from the fourth century on is, however, considerably different from this. In medieval manuscripts the cursive hand was employed from the Merovingian epoch, often in combination with the other contemporary styles, but from the ninth century it was replaced for all careful work by the so-called Caroline and Gothic characters, and continued in use up to the invention of printing only in degenerated form and for writings of small importance or hasty execution. (See *manuscript*.)

In the earliest examples of cursive writing we find the uncial character in use, and, as has been already remarked, many of the specimens fluctuate between the more formal or set book-hand and the cursive.

Encyc. Brit., XVIII. 149.

II. *n.* 1. A cursive letter or character: as, a manuscript written in *cursive*.

curve (kêrv), *a.* and *n.* [In earlier use *curb*, < ME. *courbe*, < OF. *courbe*, *corbe* (see *curb*), F. *courbe* = Pr. *corb* = Sp. Pg. *It. curvo*, < L. *curvus*, bent, curved, = O Bulg. *kriivŭ*, bent, = Lith. *kreivas*, crooked, akin to Gr. *κῠρῖος*, bent, and prob. to κῠρος, κῠρος, L. *circus*, a ring, circle: see *circle*.] **I. a.** Bending; crooked; curved.

A curve line is that which is neither a straight line nor composed of straight lines. *Ogilvie*.

II. n. 1. A continuous bending; a flexure without angles; usually, as a concrete noun, a one-way geometrical locus which may be generated by the continuous turning of a line and motion of a point along the line. All the positions of the point, taken together, make the curve, which is also the envelop of all the positions of the line. Geometers understand a curve as something capable of being defined by an equation or equations, or otherwise described in general terms. It may have nodes, cusps, and other singularities, but must not be broken in a way which cannot be precisely defined without the use of special numbers. Curves are often employed in physics and statistics to represent graphically the changes in value of certain physical or statistical quantities: as, the energy curve of the solar spectrum; the isothermal line or curve; the curve of population.

A cubic curve in a plane is one which is cut by every line in the plane in three points, real or imagi-

nary. $$y = \frac{a}{\sqrt{\pi}} e^{-a^2 x^2},$$

representing the probabilities of different numbers of recurrences of an event. — **Curve of pursuit,** the curve described by a point representing a dog which runs with constant velocity toward another point representing a hare, this second point also moving, generally in a straight line, with constant velocity. After the dog passes the hare, he runs away from it according to the same law. — **Curve of sines, cosines, tangents, secants, etc.,** curves in which the abscissas is proportional to the angle, and the ordinate to a trigonometric function of the angle. — **Cuspidal curve,** a curve on a surface along which the surface so touches itself that on cutting the surface by an arbitrary plane at every intersection of this plane with the cuspidal curve the intersection of the plane with the surface has a cusp. — **Deficiency of an algebraical curve, the number by which the number of its double points — nodes and cusps — falls short of the highest number which a curve of the same order can have.** — **Dianodal curve.** See *dianodal*. — **Distribution of a curve, in geom.,** twice the number of double points increased by three times the number of cusps. — **Elastic curve,** the figure assumed by a thin elastic plate acted upon by a force and a couple. — **Equation to a curve.** See *equation*. — **Equitangential curve,** a curve upon whose tangents a fixed line (called the *directrix*) intercepts equal distances from the points of tangency. — **Exponential curve.** See *exponential*. — **Family of curves,** a singly infinite series of curves differing from one another only by the different values assumed by one constant. — **Flexure of a curve, in math.,** the bending of it toward or away from a straight line. — **Focal curve, the locus of foci of a surface.** — **Foliate curve, Newton's 41st species** of cubic curves, a plane cubic having a crunode and a point of inflection at infinity, the inflectional tangent being an ordinary line. The form of the curve traced out by the point of light depends upon the difference of pitch between the two forks, and also upon the difference of phase. — **Loxodromic curve.** See *loxodromic*. — **Magnetic curves.** See *magnetic*. — **Mechanical curve,** a curve of such a nature that the relation between the abscissa and the ordinate cannot be expressed by an algebraic equation. I may notice that habit is formed by the frequent repetition of the same action or passion, and that this repetition is called *consuetude*, or *custom*. The latter terms, which properly signify the cause, are not unfrequently abusively employed for habit, their effect.

We are all living according to *custom*; we do as other people do, and shrink from an act of our own. *Emerson, Fortune of the Republic*.

2. In law, collectively, the settled habitudes of a community, such as are and have been for an indefinite time past generally recognized in it as the standards of what is just and right; ancient and general usage having the force of law. Some writers use the word without qualification, as meaning only *general customs*—that is, such as are prevalent throughout the nation; and some as meaning only *local or particular customs*, such as obtain only in a particular class, vocation, or place. In modern use, *custom* is more appropriate to immemorial habitudes, either general or characteristic of a particular district and having legal force, and *usage* to the habitudes of a particular vocation or trade. In the history of France the term *custom* is applied specifically to numerous systems of ancient usage which were judicially recognized as binding upon their respective communities before the revolution of 1789, or until the promulgation of the Code Napoléon: as, the *custom* of Normandy, of Brittany, of Orleans, etc. There were 90 general customs (each extending over a whole province) and 165 particular customs (those of cities, bishoprics, etc.) reduced to writing. The *custom* of Paris was established by the French as the law of Canada, and many of its provisions were embodied in the Code Napoléon.

3. The buying of goods or supplying of one's current needs; the practice of having recourse to some particular place, shop, manufactory, house of entertainment, etc., for the purpose of purchasing or giving orders.

Let him have your *custom*, but not your votes. *Addison*.

4. Toll, tax, or duty; in the plural, specifically, the duties imposed by law on merchandise imported or exported. In the United States customs are by the Constitution confined to duties on imports (on which alone they are now levied in European countries generally), and are imposed by act of Congress. They have constituted more than half the receipts of the national government. Their management is intrusted to an officer of the Treasury Department called the Commissioner of Customs. See *tariff*.

Render therefore to all their dues: tribute to whom tribute is due; *custom* to whom *custom*; fear to whom fear. *Rom. xiii. 7*.

Custom, Habit, Usage, Manner, Practice, Fashion, rule, wont.** *Custom* implies continued volition, the choice to keep doing what one has done; as compared with *manner* and *fashion*, it implies a good deal of permanence. *Habit* is a custom continued so steadily as to develop a tendency or inclination, physical or moral, to keep it up; as, the *habit* of early rising; the *habit* of smoking. *Habit* and *practice* apply more often to the acts of an individual; *fashion* and *usage* more often to many; the others indifferently to one or more. *Manner* ranges in meaning from *custom* to *habit*; as, it was the *manner* of the country. *Practice* is nearly equivalent to *custom*, but is somewhat more emphatically an act. *Fashion* is applied to those customs which go by caprice or fancy, with little basis in reason; it especially applies to trifling things, and those things which have little permanence; as, it is the *fashion* of the time; hence its application to the constantly changing styles of dress.

III *habits* soon become exalted vice.

G. *kuttelfisch*, both prob. of E. origin.] A cephalopod; specifically, a cephalopod of the genus *Sepia* and family *Sepiidae*; a dibranchiate

cephalopodous mollusk, with a depressed body, inclosed in a sac. The shorter arms or feet, eight in number, covered with four rows of raised disks or suckers, are arranged around the mouth, and from the midst of them extend two long tentacles, also furnished with disks. These members the animal uses in walking, for attaching itself to objects, and for seizing its prey. A tube or funnel exists below the head and leads from the gills, through which the water admitted to these organs is expelled; and the creature, by ejecting the water with force, can dart backward with amazing velocity. In a sac on the back of the mantle there is a light, porous, calcareous shell formed of thin plates; this is the cuttlebone or sepiot, corresponding to the calamary or pen of the squids. (See *calamary*.) The cuttlefish has the power of ejecting a black, ink-like fluid, the sepia of artists (see *sepia*), from a bag or sac, so as to darken the water and conceal itself from pursuit. From this usage the term *cuttlefish* is extended not only to all the forms of *Sepiidae* and related decapod cephalopods, but also to the octopod members of the same class. When the octopods are called cuttlefishes, the decapods are commonly distinguished as *squids*. The two figures illustrate the two principal types. bro of certain compound ascidians, as of those of the genus *Pyrosoma*, serving only to found a colony by gemmation. See the extract.

The result [of the process of yelk-division] is the formation of an elongated flattened blastoderm, which occupies one pole of the egg, and is converted into what I termed the *cyathozoid*, which is . . . a sort of rudimentary ascidian. From this, a prolongation or stolon is given off, which becomes divided by lateral constrictions into four portions, each of which gives rise to a complete ascidozooid. As these increase in size, they coil themselves round the *cyathozoid*, with their oral openings outwards and their cloacal openings inwards, and thus lay the foundation of a new ascidiarum. The *cyathozoid* eventually disappears, and its place is occupied by the central cloacal cavity. Huxley, *Anat. Invert.*, p. 528.

Cycadaceae (sik-a-dā'sē-ē), *n. pl.* [*Cycas* (*Cycad*) + *-aceae*.] A very peculiar natural order of gymnospermous plants, in many particulars having affinities with the ferns, though some of the genera resemble palms in their general appearance. They are long-lived and of slow growth. The stem is rarely branched, is elongated by a terminal bud, and bears a crown of large pinnate leaves, which are circinate in veneration. The flowers are dioecious, the male flowers in terminal cones formed of scales bearing numerous one-celled anthers on the dorsal surface. The seeds are borne on the margins of altered leaves in the genus *Cycas*, and on the inner surface of the petate scales of a cone in the other genera. The wood is without resin,

There are about 60 species, in 9 genera, of which the chief are *Cycas*, *Zamia*, *Macrozamia*, *Encephalartos*, and *Dioon*. The farinaceous pith of various species is used for food, and they are frequently cultivated in hothouses for ornament or because of their curious habit. The *Cycadaceae* are found in the various geological formations, beginning with the Permian. They are exceedingly abundant in the Mesozoic, and especially in the earlier stages of that series. (See *Mesozoic*.) On this account the Mesozoic formations are sometimes classed together as representing the "age of cycads." Cycas (si'kas), *n.* [NL., < Gr. κύκας, orig. applied to the African cocoa-palm.] 1. A genus of plants, natural order *Cycadaceae*, natives of Asia, Polynesia, and Australia. They are trees with simple stems, bearing a crown of crowded pinnate leaves with numerous narrow leaflets. The pollen is contained in valvate anthers on the under surface of scales, which are united into large cones. The seeds are

borne on the edges of greatly altered leaves, produced in the regular series of the ordinary leaves. The seeds of several species are made into flour for bread, and the pith of the trunk yields a coarse sago, whence the com-

anat., a circular or rotatory articulation, as that by means of which the head of the radius turns on the ulna, and the atlas rolls on the pivot of the axis. In the former case a circle represented by the head of the bone turns through nearly 180° upon its own center, a segment of its circumference gliding in the lesser sigmoid cavity of the ulna. In the atlanto-cyclarthrosis a ring swings back and forth upon a pivot at one point inside the circumference. Also called *rotatory diarthrosis* and *lateral ginglymus*.

Carnot's cycle, the succession of operations undergone by the substance in the interior of Carnot's imaginary engine: namely, the piston is first forced down without the escape of any heat by conduction; next, heat is communicated to the contents of the cylinder, but pressure is

removed from the piston, so that there is no change of temperature; third, the conduction of heat being stopped, further pressure is removed, so that the piston rises still further; finally, heat is removed from the contents of the cylinder, but pressure is put on to the piston so as to preserve the temperature unchanged until the body in the cylinder is brought back to its original condition; or all these operations are reversed.—**Chinese cycle.** See *seeragenary cycle*.—**Cycle of indiction**, an arbitrary period of 15 years used in Roman and ecclesiastical history. At the end of the cycle the sun was in about the same position as at the beginning; in fact, 19 tropical years are 6,939.60 days, while 235 lunations are 6,939.69 days, so that there is a difference of only about 2 hours between the two. When the point is in the circumference of the generating circle the curve generated is the common cycloid; when it is within the circle the curve is a *prolate cycloid*; and when it is on a radius produced beyond the circle the curve is a *curtate cycloid*. The cycloid is of great importance in relation to the theory of wave-motion.

2. In *ichth.*, a cycloid fish; a fish with cycloid scales, or one of the *Cycloidei*.—**Companion to the cycloid**, a curve described by the intersection of a vertical line from the point of contact of a wheel rolling on a horizontal rail with a horizontal line from a fixed point on the circumference of the wheel.

It included the families *Carcinidae*, *Portunidae*, and *Pilumnidae* of Leach. It has also been called *Carcinoidea*, and divided into the "legions" *Carcinina*, *Cyclonina*, *Corystoida*, and *Thelphusina*. It includes the principal edible crabs of the northern seas.

A circular or rotatory storm of great force, of diameter varying from 100 to 500 miles, revolving round a calm center, which advances at a rate varying from 2 to 40 miles an hour. Cyclones occur most frequently in those parts of the world subject to monsoons and in the region of the trade-winds, and seem to be eddies formed by the meeting of opposing currents of air, which accounts for the fact that they revolve in opposite directions on the opposite sides of the equator—in the southern hemisphere with, and in the northern against, the direction in which the hands of a watch move; in consequence of which, and the progression of the center, the strength of the storm in the northern hemisphere is greater on the south of the line of progression and weaker on the north than it would be if the center were stationary, the case being reversed in the southern hemisphere. Cyclones are preceded by a singular calm and a great fall of the barometer. See *anti-cyclone*.

Cyclones occur at all hours of the day and night, whereas whirlwinds and tornadoes show a diurnal period as distinctly marked as any in meteorology. Finally, cyclones take place under conditions which involve unequal atmospheric pressures or densities at the same heights of the atmosphere, due to inequalities in the geographical distribution of temperature and humidity; but whirlwinds occur where for the time the air is unusually warm or moist, and where, consequently, temperature and humidity diminish with height at an abnormally rapid rate. Cyclones are thus phenomena resulting from a disturbance of the equilibrium of the atmosphere considered horizontally, but whirlwinds and tornadoes have their origin in a vertical disturbance of atmospheric equilibrium.

Encyc. Brit., XVI. 128.

2. A severe and very destructive storm of brief duration following a narrow path, often only 100 feet wide or less, and characterized by a rotary motion about the center of low barometer; a tornado. See *tornado*, *water-*

All paved with suns that dazzle our wondering eyes.
O. W. Holmes, To Christian Gottfried Ehrenberg.

cyclopean (si-klop-ē-an), *a.* [= F. *cyclopéen*, < L. *Cyclopæus*, < Gr. Κυκλώπειος, Cyclopean (architecture), < Κυκλωπ, Cyclops.] Of or pertaining to, or exhibiting the characteristics of, any of the legendary Cyclopes. [Commonly with a capital when used with direct reference to these beings: as, *Cyclopean* architecture. See below.] Specifically—(*a.*) Having a single eye in the middle of the forehead; in *zool.*, having a median and apparently or actually single eye. This state may be normal and permanent, as in some of the crustaceans; or normal and marking a stage of development; or monstrosous, from defect of growth in the parts concerned, whereby the eyes are not separated. It occurs, for example, occasionally in the pig. (*b.*) Single and situated in the middle of the forehead, as an eye.

A true, mean, cyclopean eye would be slightly to the right of the median line. Mind, IX. 93.

(*c.*) Vast; gigantic: applied to an early style of masonry, sometimes imitated in later ages, constructed of stones either unwhewn or more or less irregularly shaped and fitted together, usually polygonal, but in some more recent examples approaching regular horizontal courses, and often presenting joints of very perfect workmanship. Such masonry was fa-

laid to be the work of the Cyclopes. It is remarkable for the immense size of the stones commonly employed, and was most frequently used for the walls of cities and fortresses. The walls of Thyrus, near Nauplia, in Greece, mentioned by Homer, are a good specimen of Cyclopean masonry. The remains of these walls consist of three courses, of which the stones, measuring from 6 to 9 feet long, from 3 to 4 feet wide, and from 2 to 3 feet deep, are rudely shaped, irregular masses piled on one another. Examples of Cyclopean work occur in Greece, Italy, Asia Minor, and elsewhere. The more primitive Cyclopean masonry in Greece, roughly built of stones entirely unwhewn, the spaces between the larger stones being filled with smaller ones, is often termed *Pelasgic*.

II. n. 1. [*cap.*] One of a sect of Greek philosophers founded by Antisthenes of Athens (born about 444 B. C.), who sought to develop the ethical teachings of Socrates, whose pupil he was. The chief doctrines of the Cynics were that virtue is the only good, that the essence of virtue is self-control, and that pleasure is an evil if sought for its own sake. They were accordingly characterized by an ostentatious contempt of riches, arts, science, and amusements. The most famous Cynic was Diogenes of Sinope, a pupil of Antisthenes, who carried the doctrines of the school to an extreme and ridiculous asceticism, and is improbably said to have slept in a tub which he carried about with him. **2.** A person of a cynical temper; a sneering faultfinder.

Cynipidae (si-nip'i-dē), *n. pl.* [*NL., < Cynips + -idae.*] A family of hymenopterous insects; the gall-flies. By means of their ovipositors they puncture plants, depositing their eggs along, it is believed, with some irritant fluid which produces tumors commonly called galls or nut-galls. Besides the true gall-flies, the *Cynipidae* include certain inquilinious and parasitic forms. The anterior wings lack a complete costal nervure and stigma (except in *Idalia*); the abdomen is generally compressed-ovate or ovate, rarely cultriform; and the ovipositor is subspirally. Nearly 400 European cynipids have been described, and about 200 from North America, many of which latter are known only by their galls. The family is divided into five subfamilies, *Cynipinae*, *Idalinae*, *Inquilinae*, *Allotricinae*, and *Figitinae*. It was called by Leach *Diplolepididae*. The name of the family is also written *Cynipides*, *Cynipites*, *Cynipiphidae*, and *Cynipiceae*. It formerly included all those baboons to which the term "dog-faced"

was applied, from the extremely prognathous jaws, giving a canine physiognomy; but it is now restricted to exclude the drill, mandrill, etc. The common baboon is *C. babuin*, inhabiting northerly parts of Africa, where it lives in troops in rocky places. In this species the tail is about one third the whole length. Closely related are the chacma, *C. porcarius*, of South Africa, and the sphinx baboon, *C. sphinx*, of West Africa. The hebe or hamadryad, *C. hamadryas*, of Abyssinia, differs in having long hair on the head and shoulders, and a shorter tail, only about one fourth of the total length. *Cynocephalus* is nearly a synonym of *Papio*, of prior date.

Cyprinidæ¹ (si-prin'i-dē), *n. pl.* [NL., < *Cyprinus* + *-idæ*.] A family of fresh-water fishes, typified by the genus *Cyprinus* (the carp), of varying limits with different authors. (a) In Cuvier's system, the first family of *Malacopterygii* *abdominales*, having a slightly cleft mouth with weak and generally toothless jaws, the border of the mouth being formed by the intermaxillaries, and the trifling armature of the jaws consisting of the deeply indented pharyngeals; a small number of branchial rays; the body scaly; and no adipose dorsal fin. (b) In Günther's system, a family of physostomous fishes, with body generally covered with scales; head naked; margin of upper jaw formed by the intermaxillaries; mouth toothless; lower pharyngeal bones well developed, falciform and parallel with the branchial arches, and provided with teeth in two or three series; air-bladder large, divided into an anterior and a posterior portion by a constriction, or into a right and a left portion inclosed in an osseous capsule (absent in *Homaloptera*); and ovarian sacs closed. (c) In Gill's system, a family of eventronathous fishes, with the margin of the upper jaw formed by the intermaxillaries alone, the pharyngeal teeth few, and three basal branchiostyles. Even with its narrowest limits, it is the largest family of fishes, containing nearly 1,000 species, which by some are referred to more than 200 genera, but by others to much fewer. Very numerous representatives occur in the fresh waters of North America, Europe, and Asia, and fewer in those of Africa, where they have apparently found their way in later Tertiary times. They are absent from the streams of South America, Australia, and all the islands of the Pacific ocean except those of the East Indian archipelago. About 250 species have been found in the United States, most of which are very small. In Europe and Asia species contribute largely to the food-supply of the people, but in America very few are of any economical importance. The most

valuable is the true carp, *Cyprinus carpio*, which has been introduced and is now largely cultivated in the United States. Another species widely dispersed is the ornamental goldfish, *Carassius* (or *Cyprinus*) *auratus*. *Dace*, *roach*, *chub*, *shiner*, and *minnow* are names applied to various species. See cuts under *carp* and *goldfish*.

Specifically—(a) Pertaining to the hepatic cyst or gall-bladder: as, the *cystic* duct (conveying gall into the gall-bladder); the *cystic* artery (a branch of the hepatic artery going to the gall-bladder); the *cystic* plexus of nerves; a *cystic* concretion; a *cystic* remedy. (b) Pertaining to the urinary bladder.

2. Resembling a cyst; cystoid; vesicular; bladdery.—3. Having a cyst or cysts; full of cysts; cystose; as, a *cystic* tumor.—4. In *zool.*, encysted; cysticeroid; hydatid; specifically applied to the encysted or hydatid state of any tapeworm (*Tenia*): opposed to *cestoid* (which see).

Also, improperly, *cistic*.

Cystic worm, or **bladder-worm**, a hydatid or scolex of a tapeworm, which may be a cysticerus with one tenia-head, or a cœnure or echinococcus with several such heads. See these words, and cut under *tenia*.

II. *n.* The hydatid or encysted state of the larva of any tapeworm.

cysticerus (sis-ti-sēr'kus), *n.* [NL., < Gr. *κυστίς*, bladder (see *cyst*), + *κέρκος*, tail.] A cystic worm or bladder-worm; a hydatid; an encysted scolex or tenia-head; the encysted state of the larva of a tapeworm. The name was originally given as a generic term, under the impression that the so-called *Cysticerus cellulose* was a distinct genus and species of a parasite. It is the larva of the *Tenia solium*, found in meaty pork, and developing in man into the tapeworm. It has but one tenia-head in the cyst, and the term *cysticerus* is retained as a convenient designation of such larva. Thus, the cysticerus of the ox becomes in man *Tenia medicamentata*; the *Cysticerus pisiformis* of the rabbit becomes *Tenia serrata* of the dog, wolf, or fox; the *Cysticerus fasciolaris* of the rat and mouse develops in the cat as *Tenia craniolepis*. The cystic worm of *Tenia cœnurus* of the dog has many heads, and is known as a cœnure; and the *Cœnurus cerebralis* is found in the brain of sheep. Another form of many-headed cystic worm, complicated by proliferation, is the larva of *Tenia echinococcus* of the dog, known as an echinococcus, *Echinococcus veteinorum* being found in the liver of man as well as of various domestic animals. See *tenia*, *cœnure*, *echinococcus*, and *scolex*.

The *cystid* is comparable to a vesicular morula.

Huxley, Anat. Invert., p. 396.

(b) The cell in which the body of the mature individual is contained, as distinguished from the polypid itself.

The body and tentacular apparatus has been incorrectly regarded as a kind of individual, and opposed to the cell or *cystid* in which it is placed, as the polypid.

(b) A cell in general.

I shall, therefore, assume provisionally that the primary form of every animal is a nucleated protoplasmic body, *cytode*, or cell, in the most general acceptance of the latter term. *Huxley, Anat. Invert., p. 583.*

cytogenesis (si-tō-jen'e-sis), *n.* [< Gr. *kytos*, a hollow (a cell), + *gēnais*, generation.] Cell-formation; the genesis or development of cells in animal and vegetable organisms: originally used in vegetable physiology. Also *cysto-genesis, cytogeny*.

cytogenous (si-toj'e-nus), *a.* [< Gr. *kytos*, a hollow (a cell), + *-genēs*, producing: see *-genous*.] Producing cells; cytogenetic: specifically applied by Kölliker to retiform, reticular, areolar, or ordinary cellular tissue, but properly predicable only of cells themselves, as all other organic structures arise from cells.

cytogeny (si'tōj'e-ni), *n.* Same as *cytogenesis*. **cytoid** (si'tōid), *a.* [< *cyte* + *-oid*.] Cell-like: a term applied by Henle to corpuscles, as of lymph, chyle, etc., which seem to resemble

each other essentially in their chemical and microscopical characters. *Dunglison*.

Cytophora (si-tof'ō-rā), *n.* pl. [NL., < Gr. *kytos*, a hollow (a cell), + *-phōros*, < *phérew* = E. *bear*.] A class of protozoans: same as *Radiolaria*.

cytoplasm (si'tō-plazm), *n.* [< Gr. *kytos*, a hollow (a cell), + *plasma*, anything formed. Cf. *cytioplasm*.] Same as *protoplasm*.

If [protoplasm] has also received from Beale, Kölliker, and Dujardin respectively, the names *bioplasm, cytoplasm, and sarcodite*. *Frey, Histol. and Histochem. (trans.), p. 66.*

cytoplasmic (si'tō-plaz'mik), *a.* [< *cytoplasm* + *-ic*.] Pertaining to cytoplasm.

Strasburger refers these phenomena to the necessity of securing for the differentiating reproductive nucleus a definite cytoplasmic medium. *Micros. Science, XXVI, 601.*

cytopysge (si'tō-pi-jē), *n.*; pl. *cytopysges*. [NL., < Gr. *kytos*, a hollow (a cell), + *pygē*, the rump.] The so-called excretory or anal aperture of unicellular animals. *Haeckel*.

cytostomous (si-tos'tō-mus), *a.* [< *cytostome* + *-ous*.] Pertaining to a cytostome.

cytotheca (si'tō-thē-kā), *n.*; pl. *cytothecae* (-sē). [NL., < Gr. *kytos*, a hollow (thorax), + *thēkē*, case.] Same as *thoracotheca*.

Cytozoa (si'tō-zō'ā), *n.* pl. [NL., < Gr. *kytos*, a hollow (a cell), + *zōon*, animal.] Same as *Sporozoa* or *Gregarinida*. See the extract.

With few (if any) exceptions, the falciform young [gregarine or sporozoon] . . . penetrates a cell of some tissue of its host and there undergoes the first stages of its growth (hence called *Cytozoa*). *Encyc. Brit., XIX, 852.*

cyttid (sit'id), *n.* A fish of the family *Cyttidae*. **Cyttidæ** (sit'id-ē), *n.* pl. [NL., < *Cyttus* + *-idæ*.] In Günther's classification of fishes, a family of *Acanthopterygii* *cotto-scombriformes*, with no bony stay for the preoperculum, an elevated body, two indistinct divisions of the dorsal fin, and an increased number of vertebrae: synonymous with *Zenidae*.

Cyttina (si-ti'nā), *n.* pl. [NL., < *Cyttus* + *-ina*.] In Günther's classification of fishes, the third group of *Scombridae*. It is characterized by a distinct division of the dorsal fin into two, the spinous being less developed than the soft part, an elevated body, and very small or rudimentary scales. The group was later raised to the rank of a family, *Cyttidae*.

cyttoid (sit'oid), *n.* [< *Cyttus* + *-oid*.] A fish of the family *Cyttidae*.

Cyttus (sit'us), *n.* [NL. (Günther, 1860), < Gr. *kyttos*, an unknown fish referred to by Athenæus in the *Deipnosophistæ*.] A genus of scombriform fishes, giving name to the family *Cyttidae*.

cytula (sit'ū-lā), *n.*; pl. *cytulæ* (-lē). [NL., dim. of Gr. *kytos*, a hollow, a cavity (a cell).] In *biol.*, a fertilized egg-cell; an impregnated ovum; the parent cell of any organism. It is the ovum of the female, which is fecundated by becoming united with the substance of one spermatozoon, or more, of the male.

The parent-cell (*cytula*), which was formerly regarded as merely the fertilized egg-cell, differs very essentially, therefore, both in point of form (morphologically), and in point of composition (chemically), and lastly also in point of vital qualities (physiologically). Its origin is partly paternal, partly maternal; and we need not, therefore, be surprised when we see that the child which develops from this parent-cell inherits individual qualities from both parents. *Haeckel, Evol. of Man (trans.), I, 182.*

cytulo-coccus (sit'ū-lō-kók'us), *n.* [NL., < *cytula*, *q. v.*, + Gr. *kókos*, berry. Cf. *cytococcus*.] Same as *cytococcus*. *Haeckel*.

czar, tsar (zār, tsār), *n.* [Also written sometimes *tsar*; prop., according to the Russ. form, *tsar*, but in E. first and still more usually *czar*; = D. *czar* = Dan. Sw. *czar* = Sp. *czar*, *zar* = Pg. *czar*, *zar* = It. *czar*, after F. *czar*, also *tsar*, *tsar*, through G. *tsar*, also *zar*, through OPol. *czar*, < Russ. *tsar*, more exactly *tsari* or *tsare* (the first letter being *tse*, the 23d letter of the Russ. alphabet, pron. *ts*, and the last being *erī* (mute final *i* or *e*), the 29th), = Pol. *car* (pron. *tsar*), formerly spelled *czar*, = Bohem. An emperor; a king; specifically, the common title of the Emperor of Russia. In old Russian annals the Mongol princes of Russia from the twelfth century are called *czars*; the first independent Russian prince to assume the title was Ivan IV., the Terrible, who in 1547 was crowned Czar of Moscow. The title *czar*, though historically equivalent, like its original *Cæsar*, to emperor, was not recognized as involving imperial rank at the time of its assumption by Ivan; and Peter the Great's assumption of such rank under the title of *imperator*, in addition to that of *czar*, was long contested by other powers.

2. An article of dress, apparently a cravat, in use in the early part of the eighteenth century: probably named in compliment to Peter the Great, who visited England in 1698.

Another Russ. form is *tsesarevichū*, > G. *Cäsarewitsch*, F. *Césarevitch*, E. *Cesarevitch* or *Cesarevitch*.] A Russian prince (imperial): formerly applied to any son of the Emperor of Russia, now specifically to the eldest son. A member of the most westerly branch of the great Slavic family of races, the term including the Bohemians, or Czechs proper, the Moravians, and the Slovaks. 1. The fourth letter and third consonant in the English alphabet: the corresponding character has the same position and the same value also in the Latin, Greek, and Phœnician alphabets, from which it comes to us. (See A.) The scheme of corresponding characters (compare the preceding letters) is as follows:

The sound which the character has from the beginning been used to represent is the sonant or voiced mute (or check, stop, contact sound) corresponding to *t* as surd or breathed, and to *n* as nasal. (See the terms used and the letters referred to.) It is generally called a "dental," but with only a conventional propriety, since the teeth bear no part in its production. It involves a closure of the tip of the tongue against the roof of the mouth at a point near to, or even touching, the upper front teeth (while an intoned or voiced current of air is driven during the closure into the cavity of the mouth, as in the case of the other sonant mutes); it is, then, rather a tongue-tip sound, or a front lingual. Sounds closely akin to it are made with different parts of the front tongue against different parts of the forward palate; hence the *d* is somewhat variously colored in various languages, and in some there are two diverse *d*'s, or even more than two. The *d*, as belonging to the fundamental or Germanic part of our language, has taken the place of a more original aspirate, namely, Sanskrit *dh*, Greek *θ*, Latin *th* or *f*: thus, English *door* = Sanskrit *dhura* = Greek *θūra* = Latin *fores*. Its regular correspondent in German is *t*: thus, *tor* (usually written *thor*) = English *door*; but, under special conditions, also a *d*: thus, German *ende* = English *end*; German *gold* = English *gold*. The German *d* regularly corresponds to English *th*. (See *th*.) Our *d* has no variety of values; it is, however, not seldom made surd, or pronounced as *t*, as in *pick-ed*, *tipped*, *kissed*, and the like, being in older words of this kind a substitute, for mechanical uniformity of spelling, for earlier *t*; *missed* being formerly *mist*, *miste*, Anglo-Saxon *miste*; *kissed*, formerly *kist*, *kiste*, Anglo-Saxon *cyste*, etc. See -*d*1 = -*ed*1, -*d*2 = -*ed*2.

2. As a numeral, in the Roman system, *D* stands for 500; when a dash or stroke is placed over it, as *D̄*, it stands for 5,000.—3. As a symbol: (a) In music: (1) The second tone, or *re*, of the scale of C. The ratio between the vibration-numbers of these two tones, when in the relation of *do* and *re*, is $\frac{9}{8}$. The tone above *bas* C is represented by *D*, the octave above *by* *d*, etc. See C, 3. (2) A note which represents this tone. On the treble staff *D* stands on the first added space below, or on the fourth line (c); and on the bass staff it stands on the third line, or on the second added space above (b). When other clefs are used, the position of *D* is different. See clef. (3) The key-note of the key of two sharps (c). (4) On the keyboard of the organ or pianoforte, the white key or digital included in each group of two black keys. (5) The string in a stringed instrument that is tuned to the tone *D*, as the third string of the violin, etc. (b) In chem., *D* is the symbol of *didymium*. (c) In math., *d* is the sign of differentiation, ∂ of partial differentiation, δ of variation, *D* of derivation (commonly in the sense of taking the differential coefficient), Δ of differencing, and ∇ of the Hamiltonian operator. Many analysts avoid the use of the letter in other senses than these. A letter subjoined to any of these signs of operation shows what is taken as the independent variable, and exponents show the number of times the operations are to be performed. Differentiation (especially when relative to the time) was formerly indicated in England by a dot over the sign of the quantity to be differentiated, this being the notation of Newton's fluxional calculus. (d) In the mnemonic words of logic, the sign of reduction to *darii*.—4. As an abbreviation: (a) In Eng. reckoning (*d.* or *d.*), an abbreviation of *denarius*, the original name for the English penny; as, £ s. d., pounds, shillings, and pence; 2s. 1d., two shillings and one penny. (b) Before a date (*d.*), an abbreviation of *diēd*. (c) In dental formulas, an abbreviation of *deciduous*, prefixed without

a period to the letters *i*, *c*, and *m*: thus, *di.*, deciduous incisor; *dc.*, deciduous canine; *dm.*, deciduous molar: all being teeth of the milk-dentition of a diphodont mammal. Thus, the milk- or deciduous dentition of a child is expressed by the formula

$$\begin{array}{ccc} di. & \frac{2-2}{2-2} & dc. & \frac{1-1}{1-1} & dm. & \frac{2-2}{2-2} = \frac{10}{10} = 20; \end{array}$$

or, more simply, taking one half of each jaw only, *di.* $\frac{2}{2}$, *dc.* $\frac{1}{1}$, *dm.* $\frac{2}{2}$ = 20. In either case the numbers above the line are those of the upper teeth, and those below the line of the under teeth. See *dental*. (d) In *anat.* and *ichth.* (*d.* or *D.*), an abbreviation of *dorsal* (vertebra or fin, respectively). (e) In a ship's log-book (*d.*), an abbreviation of *drizzling*.

A unit of linear measure; a finger-breadth; a digit; used in reference to Greek, Egyptian, and Babylonian measures. The Egyptian dactyl was precisely one fourth of a palm, and was equal to 0.74 inch, or 18.7 millimeters. The Babylonian and Assyrian dactyls are by some authors considered as the fifth part, by others as the sixth part, of the corresponding palms. The ordinary Greek dactyl was one fourth of a palm, and its value in Athens is variously calculated to be from 1.85 to 1.93 centimeters.

2. In *pros.*, a foot of three syllables, the first long, the second and third short. The dactyl of modern or accentual versification simply an accented syllable followed by two which are unaccented, and is accounted a dactyl without regard to the relative time taken in pronouncing the several syllables. Thus, the words *cheerily*, *verily*, *violate*, and *edify*, which on the principles of ancient metrics would be called respectively a dactyl (— — —), a tribrach (— — —), a Cretic (— — —), and an anapest (— — —), are all alike regarded as dactyls. The quantitative dactyl of Greek and Latin poetry is tetrasemic—that is, has a magnitude of four more (see *mora*); and as two of these constitute the thesis (in the Greek sense) and two the arsis, the dactyl, like its inverse, the anapest (— — —), belongs to the equal (isorhythmic) class of feet. The true or normal dactyl has the ictus or metrical stress on the first syllable (— — —). Its most frequent equivalent or substitute is the dactylic spondee (— —), in which the two short times are contracted into one long. Resolution of the long syllable (— — —) is rare.

If ye use too many dactils together ye make your musike too light and of no solemn grauitie, such as the amorous Elegies in court naturally require.

Puttenham, *Arte of Eng. Poesie*, p. 106.

dactylic (dak'til'ik), *a. and n.* [< *L. dactylicus*, < Gr. *δάκτυλος*, < *δάκτυλος*, a dactyl; see *dactyl*.] 1. *a.* In *pros.*, constituting or equivalent to a dactyl; pertaining to or characteristic of a dactyl or dactyls; consisting of dactyls: as, a dactylic foot; a dactylic spondee; dactylic rhythm or meter; dactylic verses. The dactylic rhythm in classical poetry was regarded as especially majestic and dignified; a continuous sequence of dactyls, however, produced a relatively lighter and more animated effect, an admixture of spondees giving a more or less heavy or retarded movement to the verse. The most frequent dactylic meter is the hexameter. Other dactylic meters were used in Greek lyric poetry, and in the drama, especially in the earlier period, or in passages expressing lamentation (monodies and comatias). See *hexameter* and *elegiac*.

The classical *dactyliomancy*, of which so curious an account is given in the trial of the conspirators Patricius and Hilarius, who worked it to find out who was to supplant the emperor Valens. A round table was marked at the edge with the letters of the alphabet, and with prayers and mystic ceremonies a ring was held suspended over it by a thread, and by swinging or stopping towards certain letters gave the responsive words of the oracle.

See *shogun*. Though exercising independent authority in their own domains, the daimios acknowledged the mikado as the legitimate ruler of the whole country. During the Tokugawa shogunate (1603-1868) the daimios gradually became subject to the shoguns, who compelled them to live in Yedo, with their families and a certain number of their retainers, for six months of every year, and on their departure for their own provinces to leave their families as hostages. The number of daimios differed at different times, according to the fortunes of war and the caprice of the shoguns. Just before the abolition of the shogunate there were 255, arranged in five classes, with incomes ranging from 10,000 to 1,027,000 koku of rice per annum. In 1871 the daimios surrendered their lands and privileges to the mikado, who granted pensions proportioned to their respective revenues, and relieved them of the support of the samurai, their military retainers. These pensions have since been commuted into active bonds, redeemable by government within thirty years from date of issue. Specifically.—7. To diminish or destroy the oscillation of (a metallic body in motion in a

magnetic field). When a conductor is moved in a magnetic field, or when a magnet is moved in the vicinity of a conductor, there will be, in general, an induced current generated which will oppose the motion to which it is due. The moving body will act as if immersed in a viscous liquid, and will move quickly come to rest. Advantage is taken of this fact in stilling the vibrations of a magnetic needle in a galvanometer or a compass by placing masses of conducting metal near the vibrating body. Damping is also accomplished by attaching to the needle a disk, cylinder, or vane, which swings in a liquid or in air.

[*Dampen* is now more common in the literal sense, and is sometimes used in the derived senses.]

(2) In the pianoforte, a small piece of wood or wire thickly covered with felt, which rests upon the strings belonging to each key of the keyboard. When the key is struck the damper is drawn away from the strings, but the instant the key is released the damper returns and checks the vibrations of the strings. The dampers of all the keys can be raised by pressing the damper-pedal (which see), so that the vibration of the strings can be prolonged after the finger has left the key. (3) The mute of a brass instrument, as a horn. (4) An arrangement for arresting the vibrations of a magnetic needle. The prince of darkness, the devil; Satan. = *Syn. Dark-
ness, Obscurity, Dimness, Gloom.* Darkness is the opposite
of light, physical or mental, and indicates the complete,

the state of being overclouded or concealed through the
intervention of something which obstructs or shuts out
the light, causing objects to be imperfectly illuminated:
as, the obscurity of a landscape; the style of this author
is full of obscurity. Dimness is indistinctness caused by
the intervention of an imperfectly transparent medium,

is specifically applied to the sight itself: as, dimness of
vision. Gloom is deep shade, approaching absolute dark-
ness, but is now much less often used in that sense, or in
the sense of a corresponding darkness of mind, than to ex-
press a state of feeling akin to darkness; the lack of abili-
ty to see light ahead; deep despondency; lack of hope or

Darwinism (där-win-izm), *n.* [F. *Darwin* (see def.) + *-ism*.] 1. The body of biological doctrine propounded and defended by the English naturalist Charles (Charles Robert) Darwin (1809–1882), especially in his works "The Origin of Species" (1859) and "The Descent of Man" (1871), respecting the origin of species. It is, in general, the theory that all forms of living organisms, including man, have been derived or evolved by descent, with modification or variation, from a few primitive forms of life or from one, during the struggle for existence of individual organisms, which results, through natural selection, in the survival of those least exposed, by reason of their organization or situation, to destruction. It is not to be confounded with the general views of the development or evolution of the visible order of nature which have been entertained by philosophers from the earliest times. (See *evolution*.) That which is specially and properly *Darwinian* in the general theory of evolution relates to the manner, or methods, or means by which living organisms are developed or evolved from one another: namely, the inherent susceptibility and tendency to variation according to conditions of environment; the preservation and perfection of organs best suited to the needs of the individual in its struggle for existence; the perpetuation of the more favorably organized beings, and the destruction of those less fitted to survive; the operation of natural selection, in which sexual selection is an important factor; and the general proposition that at any given time any given organism represents the result of the foregoing factors, acting in opposition to the hereditary tendency to adhere to the type, or "breed true." See *selection* and *survival*.

=Syn. Dash, Smash, Shatter, Shiver, Crush, Mash. That which is dashed does not necessarily go to pieces: if it is broken, the fact is commonly expressed. That which is smashed, shattered, or shivered is dashed to pieces suddenly, with violence, at a blow or in a collision. *Smashing* is the roughest and most violent of the three acts; the word expresses the most complete disruption or ruin: as, the drunken soldier *smashed* (shattered, shivered) the mirror with the butt of his musket. The use of *smash* or *dash* for *crush* (as, his head was *smashed*, I *smashed* my finger) is colloquial. *Shatter* and *shiver* differ in that *shatter* suggests rather the flying of the parts, and *shiver* the breaking of the substance; and the pieces are more numerous or smaller with *shiver*. That which is *crushed* or *mashed* is broken down under pressure; that which is *mashed* becomes a shapeless mass: sugar and rock are *crushed* into powder, small particles, or bits; apples are *crushed* or *mashed* into pulp in making cider; boiled potatoes are *mashed*, not *crushed*, in preparing them for the table.

They that stand high have many blasts to shake them;
And, if they fall, they dash themselves to pieces.

7. (a) In writing and printing, a horizontal stroke or line of varying length, used as a mark of punctuation and for other purposes; specifically, in printing, a type the face of which consists of such a line. The dashes regularly furnished in a font of type are called respectively the *em dash* (—, a square of the size of the font), the *en dash* (—, half a square), the *two-en dash* (—, two squares), and the *three-em dash* (—, three squares). In punctuation, the *em dash* is used to note a sudden transition or break of continuity in a sentence, more marked than that indicated by a comma, and also at the beginning and end of a parenthetical clause—properly of one more directly related to the general sense than a true parenthesis. (See *parenthesis*.) The *en* or the *em dash* is often used to indicate the omission of the intermediate terms of a series which are to be supplied in reading, being thus often equivalent to "to . . . inclusive"; thus, Mark iv. 3—20, or 8—20 (that is, verses 3 to 20, inclusive); the years 1880—88 (that is, 1880 to 1888). As a mark of hiatus or suppression, the dash—usually one of the longer ones—stands for something omitted, as a name or part of a name, the concluding words of an unfinished sentence, or the connecting words of a series of broken sentences. Various other more or less arbitrary uses are made of dashes, as in place of *do*, (*ditto*) to indicate repetition of names in a catalogue or the like, as a dividing line between sections, articles, or other portions of matter, etc.

Observe well the dash too, at the end of this Name.

Wycherley, Plain Dealer, v. 1.

(b) In printing, also, a line (variously modified in form) used for the separation of distinct portions of matter, as the parallel dash (—), the double dash (—), the diamond or swell dash (—), etc. (c) Any short mark or line.

(c) In harpsichord-music, a coulé (which see).—9. It includes the whole of the family except the pacas, and is characterized by having only 3 developed toes on the hind feet. It comprehends all the agoutis and the acouchy, as the yellow-rumped agouti (*D. agouti*), Azara's agouti (*D. azarae*), and the acouchy (*D. acouchy*). *D. acouchy* inhabits some of the West Indies as well as South America; the other species of the genus are confined to South America. See cuts under *acouchy* and *agouti*.

the former of which contains the paca alone (*C. paca*), the latter the agoutis. The nails of the feet are hoof-like; the fore feet are 5-toed; the hind feet have also 5 toes (paca), or only 3 (agoutis); the tail is rudimentary or very short; the ears are low; and the upper lip is not cleft. Contrary to the rule in the hystriacine series of rodents, the clavicles are rudimentary; and the molar teeth are semi-rooted, and the incisors long. The *Dasyproctidae* are related to the cavies and chinchillas (see *cavy* and *chinchilla*); they are confined to the Neotropical region, inhabiting parts of Mexico, some of the West Indies, and the greater part of South America, especially wooded and watered localities. See cuts under *agouti* and *Ceologenys*.

Dasypus (das'i-pus), *n.* [NL., < Gr. *dasys*, hairy, rough-footed; used only as a noun, a hare, rabbit; < *dasys*, hairy, rough, + *pus* (pod-) = *E. foot*.] A genus of armadillos, formerly conterminous with the family *Dasypodidae*, now restricted to certain species of the subfamily *Dasypodinae* (which see). See also cut under *armadillo*.

Dasyuridae (das-i-ü'ri-dé), *n. pl.* [NL., < *Dasyurus* + *-idae*.] A family of polyprotodont marsupial mammals. They have 4 incisors in each half of the upper and 3 in each half of the lower jaw; the canines well developed; the hind feet with the clawless hallux small and rudimentary, rarely apposable; the limbs of proportionate length; the stomach simple; and no caecum. They are predatory carnivorous or insectivorous marsupials of Australia, Tasmania, New Guinea, and some other islands. They are divided into the two subfamilies *Dasyurinae* and *Myrmecobinae*. These animals are sometimes known indiscriminately as brush-tailed opossums.

Dasyurinae (das'i-ü'ri-né), *n. pl.* [NL., < *Dasyurus* + *-inae*.] A subfamily of *Dasyuridae*; the *dasyures*. The tongue is not specially extensible, and the premolars and molars are not more than 7 in number; in these respects the subfamily is contrasted with *Myrmecobinae* (which see). The leading genera are *Dasyurus*, *Sarcophilus*, and *Thylacinus*, or the true, the ursine, and the thylacine *dasyures*, and *Phascogale*; the last is properly made the type of a different subfamily, *Phascogalinae*.

That part of a writing or an inscription which purports to specify the time when, and usually the place where, it was executed. A full date includes the place, day, month, and year; but in some cases the date may consist of only one or two of these particulars, as the year on a coin. In letters the date is inserted to indicate the time when they are written or sent; in deeds, contracts, wills, and other papers, to indicate the time of execution, and usually the time from which they are to take effect on the rights of the parties; but the written date does not exclude evidence of the real time of execution or delivery, and consequent taking effect. In documents the date is usually placed at the end, but may be at the beginning, as it is now generally in letters.

date-line (dät'lin), *n.* The boundary-line between neighboring regions where the calendar day is different. This line runs through the Pacific ocean, and is supposed to coincide with the meridian of 12 hours or 180° from Greenwich; but it practically follows a somewhat devious course, and is sometimes confused. Thus the Sundays of the Russian and of the American settlers in Alaska formerly fell upon different days. On the east of the date-line the nominal date is one day earlier than on the west of it; so that the American Sunday in Alaska coincides with the former Russian Monday.

date-mark (dāt'märk), *n.* A special mark stamped on an article of gold or silver to indicate the year of manufacture. Thus, in the London Goldsmiths' Company, during the twenty years from 1856 to 1875 this mark was a letter of the alphabet in small Old English character; for the next twenty years, beginning in 1876 and ending in 1895, Roman capitals were adopted.

date-palm (dāt'pām'), *n.* The common name of *Phoenix dactylifera*, the palm-tree of Scripture; also called *date-tree*. Next to the coconut-tree, the date is unquestionably the most interesting and useful of the palm tribe. As with the coconut-tree, nearly every part is applied to some useful purpose, and the fruit not only affords the principal food of the inhabitants of various countries, but is a source of a large part of their traffic. It is cultivated in immense numbers all over the northern part of Africa as well as in southwestern Asia, and is found through southern Europe, though rarely productive there. Its stem shoots up to the height of from 60 to 80 feet, without branch or division, and is of nearly the same thickness throughout its length. From the summit it throws out a magnificent crown of large feather-shaped leaves, and a number of spadices, each of which in the female plant bears a bunch of from 180 to 200 dates, each bunch weighing from 20 to 25 pounds. The fruit is eaten fresh or dried. The best dates of commerce are obtained from the coasts of the Persian gulf, where the tree is cultivated with great care, and where over 100 varieties are known. The date-palm was probably originally derived from the wild date-palm, *P. sylvestris*, which is found throughout India, and is planted very extensively in Bengal, chiefly for the production of toddy and sugar. See *Phoenix*.

Datisca (da-tis'kā), *n.* [NL., *< Datisca* + *-aceæ*.] A small natural order of plants, with apetalous flowers, but having closer affinities with the *Cucurbitaceæ* and *Begoniaceæ* than with any of the apetalous orders, and united by Baillon with the *Saxifragaceæ*. There are only three genera, of which *Datisca* is the best-known.

datiscin (da-tis'in), *n.* [*< Datisca* + *-in*.] A substance (C₂₁H₃₂O₁₂) having the appearance of grape-sugar, first extracted by Braconnot from the leaves of *Datisca cannabina*. It has been used as a yellow dye.

datisi (da-ti'si), *n.* The mnemonic name given by Petrus Hispanus to that mood of the third figure of syllogism in which the major premise is universal and affirmative, and the minor premise and conclusion are particular and affirmative. These distinctions of quantity and quality are indicated by the vowels of the word, *a-i-i*. The letter *s* after the second vowel shows that the mood is reduced to direct reasoning by the simple conversion of the minor, and the initial *d* shows that the resulting mood is *darli*. The following is an example of a syllogism in *datisi*: All men irrationally prejudiced have weak minds; but some men irrationally prejudiced are learned; hence, some learned men have weak minds.

dativo (dā'tiv), *a. and n.* [= *F. datif* = *Pr. datiu* = *Sp. Pg. It. dativo* = *D. datief* = *G. Dan. This case is found in all the ancient languages of our family, and is widely preserved even among the later. Though nowhere distinguished in form from the accusative or objective in modern English, it is really present in such expressions as, *give him his due*; *show this man the way*; and *him, whom, them*, and (in part) *her* are historically datives, retaining a dative termination. The precise value of the original Indo-European dative is a matter of doubt and dispute. Abbreviated *dat*.

A fact given; originally, one of the quantities stated, or one of the geometrical figures supposed constructed, in a mathematical problem, and from which the required magnitude or figure is to be determined. But Euclid uses the corresponding Greek term (δέδοται) in a second sense, as meaning any magnitude or figure which we know how to determine.

2. A fact either indubitably known or treated as such for the purposes of a particular discussion; a premise.—3. A position of reference, by which other positions are defined.

There are several species, all of them possessing poisonous properties and a disagreeable odor. *D. Stramonium* is the thorn-apple, all parts of which have strong narcotic properties. It is sometimes employed as a remedy for neuralgia, convulsions, etc., and the leaves and root are smoked for asthma. The plant is supposed to be a native of western Asia, but is now found as a weed of cultivation in almost all the temperate and warmer regions of the globe. In some parts of the United States it is called the *jimson* (which see). *D. fastuosa* and *D. Metel* of India possess qualities similar to *D. Stramonium*. *D. arborea*, also known as *Brugmansia suaveolens*, a native of South America, is a shrubby plant with very large fragrant white blossoms, and is sometimes found in greenhouses.

3. The whole time or period of one revolution of the earth on its axis, or the space of twenty-four hours; specifically, the interval of time which elapses between two consecutive returns of the same terrestrial meridian to the sun. In this latter specific sense it is called the *natural*, *solar*, or *astronomical day*. Since the length of this day is continually varying, owing to the eccentricity of the earth's orbit and the obliquity of the ecliptic, a *mean solar day* (the *civil day*) is employed, which is the average period of one revolution of the earth on its axis relative to the sun's position considered as fixed. The day of twenty-four hours may be reckoned from noon to noon, as in the *astronomical* or *nautical day*, or from midnight to midnight, as in the *civil day* recognized in the United States, throughout the British empire, and in most of the countries of Europe. The Babylonians reckoned the civil day from sunrise to sunrise; the Umbrians, from noon to noon; the Athenians and Hebrews, from sunset to sunset; and the Romans, from midnight to midnight.

And the evening and the morning were the first *day*.

A French preposition, found in English only in some French phrases, as *couleur de rose*, or in proper names, as in *Simon de Montfort*, *Cœur de Lion*, *De Vere*, etc., either of Middle English origin, or modern and mere French.

Its use in such names, following the name proper, and preceding what was originally, in most cases, the name of an estate, led to its acceptance as evidence of noble or gentle descent, corresponding in this to the German *von* and the Dutch *van*. But as the particle in proper names often originated without any such implication, and has also been often assumed without authority, it is in itself of no value as such evidence.

2. A Latin preposition, meaning 'from' or 'of,' occurring in certain phrases often used in English: as, *de novo*, anew; *de facto*, of fact; *de jure*, of right.

dis-, dif-. 1. A verb-prefix of Latin origin, expressing in Latin, and hence with modifications in modern speech, various phases of the original meaning 'from, away from, down from.' (1) Separative, denoting departure or removal—'off, from off, away, down, out,' or cessation or removal of the fundamental idea: *de-* privative, equivalent to *un-* or *dis-* privative. (2) Completive—'through, out, to the end,' etc. (3) Intensive: a force often lost in English. (See examples following.) In some words the separative or privative force of this prefix is felt in English, as in *decompose*, *denote*, being in such meaning often used as an English prefix (*de-* privative), as in *decentralize*, *de-Saxonize*, *derail*, etc. It is less distinctly felt in words like *depress*, *detract*, etc.; and in many words, where it is not in Latin the completive or intensive force, its force is not felt in English, as in *deride*, *denote*, etc.

2. In some words a reduced form of the original Latin prefix *dis-*, Latin *de-* and *dis-* being in Old French and Middle English more or less merged in form and meaning (see *dis-*). See *defer*², *deface*, *defame*, *deery*, etc.

de-. A form of *-d-*, *-d-*, or *-d-*, *-ed*² in older English, as in *solde*, *tolde*, *fledde*, etc., now extant only in *made*, the (contracted) preterit and past participle of *make*. See *-ed*¹, *-ed*².

deacon (dē'kən), *n.* [Early mod. E. also *deken*; < ME. *deken*, *dekyn*, *decon*, *deacon*, *diacne*, *deaulne*, < AS. *deadcon*, *diakon* = D. *deken*, *diaken* = MLG. *diaken* = G. *diakon*, *diakon* = Icel. *djākn*, *djākn*, *n.*, a deacon, = Dan. *degn*, a parish clerk, = Sv. *djēkne*, a scholar (Dan. Sw. *diakon*, *deacon*), = OF. *diacne*, *diacre*, F. *diacre* = Pr. *diacre*, *diague* = Sp. *diácono* = Pg. It. *diácono*, < LL. *diáconus* = Goth. *diakunus*, a deacon, < Gr. *diákonos*, a servant, waitingman, messenger, eccles. a deacon; of uncertain origin; perhaps related to *diakew*, pursue, cause to run. The Teut. forms appear to have been in part confused with the forms belonging to L. *deamus*, a dean (see *dean*²), and with those belonging with G. *degen*, etc., AS. *thegn*, E. *thane* (see *thane*).] 1. Eccl., one of a body of men, either forming an order of the ministry or serving merely as elected officers of individual churches, whose chief duty is to assist a presbyter, priest, or other clergyman, especially in administering the eucharist and in the care of the poor. (a) In the apostolic church, one of an order of ministers or church-officers, inferior to apostles and presbyters, whose duty it was to serve at the Lord's Supper, or agape, and to minister alms to the poor. It is generally believed that the institution of this office is recorded in Acts vi. 1-6, where, although the word *deacon* (*διάκονος*, minister) is not used of the seven persons appointed, the corresponding words "to minister or serve" (*διακονεῖν*) and "ministration" (*διακονία*) are employed. By an analogy with the Messianic hierarchy, St. Clement of Rome in the apostolic age called the deacons *Levites*, and this use of the word *Levite* long remained frequent. (b) In the early Christian church, one of the third order of the ministry, of lower rank than bishops and presbyters. The deacons applied complete unction to men in preparation for baptism, but anointed women on the forehead only, assisted the celebrant at the eucharist, read the gospel and made proclamations during the liturgy, maintained order in the congregation, and cared for the poor and sick. Those attached to episcopal sees acted as the bishop's adjutants, messengers and representatives, and when belonging to a great patriarchal or metropolitan see possessed much influence. Hence—(c) In the Greek church, one of the third order of the ministry, similar in rank and duties to the officer of the same name in the early church. (d) In the Roman Catholic Church, a member of the third order of the ministry. He assists the priest throughout the celebration of the eucharist or mass, and reads the gospel. The principal assistant to the celebrant at a solemn celebration is called the *deacon*, and vested accordingly, whether in deacon's, priest's, or bishop's orders. (e) In the Anglican Church, a member of the third order of the ministry. His duties are to assist the priest in divine service, especially at the holy communion, help in distributing the elements to the people, read the Scriptures, especially the eucharistic gospel, catechize, baptize infants in the absence of the priest, preach if licensed by the bishop, and seek out the sick and poor and make their wants known to the curate. Deacons cannot consecrate the eucharist, pronounce absolution, or give benediction. The bishop, priest, or deacon who acts as principal assistant at the holy communion is called the *deacon* or *gospel*. (f) In the Methodist Episcopal Church, a member of an order of the ministry next below that of elder. The deacons are elected by the annual conference, are ordained by the bishop, and are authorized to assist in the administration of the eucharist, to administer the rites of baptism and marriage, and to perform the duties of a traveling preacher. (g) In the Baptist and Congregational churches, one of two or more officers elected by each church to distribute the elements in the communion after they have been consecrated by the minister, and to act as the advisers of the pastor and as the almoners of the charities of the church. (h) In the Presbyterian Church, one of a number of officers elected by a congregation and ordained by the minister to assist the session in the care of the poor and in the general management of the secular affairs of the church. Deacons are not always appointed, their place being sometimes supplied by the elders. (i) In the Lutheran Church in the United States, one of a number of laymen chosen to at-

tend to the charities and temporalities of a congregation. With an equal number of elders and the pastor, the deacons constitute the council of each church to manage its temporal and spiritual affairs. (j) In the Mormon Church, a subordinate official who acts as an assistant to the teacher, but has no authority to baptize or administer the sacrament. *Mormon Catechism*, xvii.

2. In Scotland, the president of an incorporated trade, who is the chairman of its meetings and signs its records. Before the passing of the Burgh Reform Act the deacons of the crafts or incorporated trades in royal burghs formed a constituent part of the town council, and were understood to represent the trades, as distinguished from the merchants and guild brethren. The deacon-convenor of the trades in Edinburgh and Glasgow still continues to be a constituent member of the town council.

3. [Allusion not clear.] A green salted hide or skin weighing less than 8 pounds.—*Cardinal deacon*. See *cardinal*.—*Deacons' seat*, in New England, a pew formerly made in the front of the pulpit for deacons to occupy.—*Regentary deacon*, in the early church, a deacon attached to one of the seven ecclesiastical regions into which Rome was divided from very early times. There was one deacon for each region.

deacon (dē'kən), *v. t.* [*deacon*, *n.*] 1. To make or ordain deacon.—2. To read out, as a line of a psalm or hymn, before singing it: sometimes with *off*: from an ancient custom of reading the hymn one or two lines at a time, the congregation singing the lines as read. This office was frequently performed by a deacon. The custom is nearly as old as the Reformation, and was made necessary by the lack of hymn-books when congregational singing was introduced. See *line*, *v. t.*

A prayer was made, and the chorister deaconed the first two lines. *Goodrich, Reminiscences*, I. 77.

3. To arrange so as to present a specious and attractive appearance; present the best and largest specimens (of fruit or vegetables) to view and conceal the defective ones: as, to *deacon* strawberries or apples. [Slang, U. S.] [This sense contains a humorous allusion to the thrifty habits ascribed to the rural New England deacons.] Hence—4. To sophisticate; adulterate; "doctor": as, to *deacon* wine or other liquor. [Slang.]—*Deaconed veal*, veal unfit for use, as when killed too young. [Connecticut.]

deaconess (dē'kən-es), *n.* [Formerly also *deaconisse*; = D. *diakoness* = G. *diakoniss-in* = Dan. *diakonisse* = F. *diaconesse*, *diaconisse* = Sp. Pg. *diakonisa* = It. *diaconessa*, < ML. *diaconissa*, fem. of *diakon*, *deacon*: see *deacon* and *-ess*.] 1. One of an ecclesiastical order of women in the early church, who discharged for members of their own sex those parts of the diaconal office which could not conveniently or fitly be performed by men. They acted as doorkeepers and kept order on the women's side of the congregation, assisted at the baptism of women and administered the unction before baptism except the anointing of the forehead, instructed female catechumens, took charge of sick and poor women, and were present at interviews of the clergy with women. Such an order was especially needed in those Christian countries where Oriental seclusion of women prevailed. Deaconesses were required to remain unmarried, and were generally selected from the consecrated virgins or from the order of widows. In the Eastern Church the order continued into the middle ages, but it is not certain when it became extinct. In the Western Church it was abolished by successive decrees of councils during the fifth and succeeding centuries, and became finally extinct about the tenth. Abbesses were sometimes called deaconesses after the order became obsolete.

And Rom. xvi. I commendeto you Phoebe, the deaconess of the church of Cenchris. *Tyndale, Works*, p. 250. So Epiphanius: There is an order of deaconesses in the church, but not to meddle, or to attempt any of the holy offices. *Jer. Taylor, Office Ministerial*. 2. A member of an order of women more or less fully established in recent times in several Protestant churches, with duties similar to the preceding; also, a member of the Institution of Deaconesses first established by Pastor Fliedner, of the United Evangelical Church of Prussia, at Kaiserswerth in 1836. The latter are wholly devoted, by engagements for fixed periods, to charitable work, as the nursing of the sick, etc. They reside in special houses, which have been established in many parts of the world.

Dumbness is the usual concomitant of complete deafness, but in general results rather from the absence of incitement by the sense of hearing than from any natural defect in the organs of speech. The *AS.* word has suffered a similar restriction of meaning, being now *E. thill*, the shaft or pole of a cart, etc. Thus *deal*² is a doublet of *thill*: see *thill*. The word *deal*² is usually identified with *deal*¹, a part, with the accommodated definition "the division of a piece of timber made by sawing." 1. A board or plank. dean¹ (dēn), *n.* [Also *denel*; < *ME. dene*, < *AS. denu*, a valley: see *den*².] A small valley.

dean² (dēn), *n.* [*< ME. deen*, *dene*, *den*, < *OF. deien*, mod. *doyen* = *Pr. degua*, *dega* = *OSP. dean*, *Sp. decano* = *Pg. deão* = *It. decano* (*G. dekan*, *dechant* = *D. deken*), < *LL. decanus*, one set over ten (soldiers, monks, etc.), < *L. decem* = *E. ten*: see *decimal*, *ten*.] 1. An ecclesiastical title in the Roman Catholic and Anglican churches, which has had several applications. Civil officials so called were known to the Roman law, and are mentioned in the codes of Theodosius and Justinian. The title was thence adopted for Christian use. In the monasteries, for every ten monks a decanus or dean was nominated, who had the charge of their discipline. The senior dean, in the absence of the abbot and provost, governed the monastery; and, since monks had the charge of many cathedral churches, the office of dean was thus introduced into them. Custom gradually determined that there should be only one dean in a cathedral, and he eventually assumed the chief charge of its ecclesiastical and ritual concerns, especially in regard to the choir. He became also general assistant to the bishop. In the Roman Catholic Church, assistants of the bishop, termed *rural deans*, in France in former times often possessed, and in Germany in certain cases still possess, large powers of visitation, administration, and jurisdiction, so that their authority is almost equal to that of bishops. In the Church of England there are, besides the deans of the cathedrals, called *deans of chapters*, whose authority is next that of the bishop, *rural deans*, who are in effect assistants to the bishop, and whose duty it is to visit certain parishes in the diocese, and report on their condition to the bishop. Their functions at one time became almost obsolete, but they have been revived to some extent in recent times. The word is also applied in England to the chief officers of certain peculiar churches or chapels: as, the *dean of the king's chapel*. In the Episcopal Church in America the presiding presbyter of the semi-official body known as a convocation, and of the division of a diocese represented by this body, which division is also called a convocation and is in some respects analogous to the English rural deanery, is called a dean (the dean of convocation).

To save a bishop, may I name a dean?
Pope, Epil. to Satires, ii. 33.

2. In universities, originally, the head of a faculty (and most historical writers consider a

dean as essential to the existence of a faculty). The office was at first directly or indirectly elective for one or two years, while commonly filled by the eldest master regent. But the faculties, having in Great Britain and America lost their early more independent corporate existence, are now usually presided over by the head of the university, and the office of dean has sunk to that of a mere registrar or secretary, or has ceased to exist. In English colleges the dean presides in chapel, looks after the moral and religious welfare of the scholars, and is charged with the preservation of discipline. The office is commonly united with one of the tutorships. The office of dean of a college or school is evidently a mere adaptation of that of dean of a monastery, and as such dates from far earlier times than that of dean of a faculty, although the faculties long preceded the colleges.

Certain censors, or *deanes*, appointed to look to the behaviour and manner of the Students there [at Cambridge].
Holmshed, Chronicles.

He long'd at college, only long'd,
All else was well, for she-society. . .
They lost their weeks; they vex't the souls of deans.
Tennyson, Princess, Prol.

3. The oldest member in length of service of a constituted body, or a body of persons of equal rank, of whom he is the prescriptive leader in all joint action: as, the *dean* of the diplomatic corps; the *dean* of the French Academy; the *dean* of the Sacred College (the oldest of the cardinals, who possesses high authority by right of his seniority).—4. The president for the time being of an incorporation of barristers or law practitioners.—*Dean and chapter*, a bishop's council, consisting of the dean and his prebendaries, whose duties consist in aiding the bishop with their advice in affairs of religion and in the temporal concerns of his see.—*Dean of Arches*, the chief judicial officer of the Archbishop of Canterbury, dean of the Court of Arches, but not really a dean in the modern sense of the word.—*Dean of Faculty*, the president of the Faculty of Advocates in Scotland.—*Dean of guild*. (a) The chief officer of a medieval trade-gild, and of some existing gilds in Europe.

They represented that it had been customary to consult, after the city magistracies, only the captains of companies and the *deans* of guilds in matters of government.
Motley, Dutch Republic, III. 20.

(b) In Scotland, the elected head of the merchant company or gildry of a royal burgh, who is a magistrate of the burgh for the supervision of all matters relating to the erection and character of buildings. The office in the full sense now exists only in Edinburgh, Glasgow, Aberdeen, and Perth, its duties in other burghs being performed by an officer bearing the same title, elected by the town council.—*Dean of gild court*, in Scotland, a court presided over by the dean of gild, the jurisdiction of which is confined to the regulation of buildings, to such matters of police as have any connection with buildings, and to the regulation of weights and measures.—*Dean of peculiars*. See *peculiar*.—*Dean of the chapel royal*, a title bestowed on six clergymen of the Church of Scotland, who receive from the crown a portion of the revenues which formerly belonged to the chapel royal in Scotland.—*Dean of the province of Canterbury*, the Bishop of London, to whom, when a convocation is to be assembled, the archbishop sends his mandate for summoning the bishops of the province.

Hence, as Mr. Fiske has shown in detail, so soon as anthropomorphism has assumed its highest state of development, it begins to be replaced by a continuous growth of *deanthropomorphism*, which, passing through polytheism into monotheism, eventually ends in a progressive "purification" of theism—by which is meant a progressive metamorphosis of the theistic conception, tending to remove from the Deity the attributes of Humanity.

The number ten; in a Pythagorean or cabalistic sense, as an element of the universe, the tetractys or quaternary number. In this sense the form *decad* is exclusively used. The *decad* was considered significant as being the base of numeration and potentially embracing all numbers, and thus representing the cosmos or its source. It was further considered as highly significant that the *decad* is 1 + 2 + 3 + 4, for four naturally suggests organic perfection, since melodies and other compositions are best divided into four parts, and for other reasons; so that the greatness of Pythagoras as a philosopher was summed up in his title of "revealer of the quaternary number." By cabalists it is considered important as being the number of the commandments.

All numbers and all powers of numbers appeared to them [the Pythagoreans] to be comprehended in the *decad*, which is therefore called by Philolaus great, all-powerful, and all-producing, the beginning and the guide of the divine and heavenly, as of the terrestrial life.

Decapoda (de-kap'ō-dā), *n. pl.* [*NL.*, neut. pl. of *decapus*, having ten feet: see *decapod*.]

1. The ten-footed crustaceans; those *Crustacea* which have five pairs of legs or ambulatory appendages, at least one pair of which is chelate; an order of podophthalmic or stalk-eyed *Crustacea*. See cuts under *Podophthalmia* and *stalk-eyed*. They have the branchiae inclosed in special lateral thoracic receptacles; a large dorsal carapace or cephalothoracic shield, formed by fusion of the cephalic and thoracic somites, and usually prolonged in front as a beak or rostrum; gnathites or mouth-parts consisting of a pair of mandibles, two pairs of maxillae, and three pairs of maxillipeds or foot-jaws; and five pairs of ambulatory legs, the first pair of which is usually enlarged, and otherwise modified into great pincer-like claws or chelipeds. The shell is regularly shed, annually or oftener, as long as the animal continues to grow. The order presents two extremes of form, according to the development and construction of the abdominal segments or "tail." In the long-tailed or macrurous *Decapoda*, as the lobster, shrimp, prawn, and crawfish, the abdomen is protruded, jointed, and flexible. In the short-tailed or brachyurous *Decapoda*, as the crabs, it is reduced and folded under the thorax, forming the apron. Various intermediate conditions are also found, as in the hermit-crabs. In consequence the *Decapoda* are divided into *Macrura* and *Brachyura*, with or without an intermediate group *Anomura*. See these words.

2. The ten-armed cephalopods; a division of the dibranchiate or acetabuliferous *Cephalopoda*, as distinguished from *Octopoda*, having two long tentacles or cephalic processes (besides the eight arms or rays), bearing suckers only at their ends: also called *Decacera*. Heylin, Hist. Presbyterians, p. 469.

Decimal arithmetic, the ordinary method of arithmetical calculation by the Arabic notation. The term is sometimes restricted to the calculation with decimals.—**Decimal currency**. See *currency*.—**Decimal fraction**, a fraction whose denominator is a power of 10, or long as the quantity is conceived as having a power of 10 for its denominator it is properly and usually called a decimal fraction, however it may be written. The ordinary method of writing it is by prefixing to the numerator (used alone) a dot (the decimal point) with a number of zeros sufficient to make the number of places in the numerator equal to that in the denominator, less one. Thus, $\frac{1}{10} = .1$, $\frac{10}{100} = .10$, $\frac{100}{1000} = .100$, etc.; $\frac{2}{5} = .4$, etc. See II.—**Decimal measure**, any measure belonging to a decimal system.—**Decimal notation**, a system of writing numbers depending on powers of 10, especially the ordinary system by means of nine digits and a cipher. The system in an imperfect form, wanting the 0 (the places being preserved by ruled columns), is believed to have been invented in India, and is explained in the Latin geometry of Boethius (died about A. D. 525). The genuineness both of the passage and of the entire work has been much disputed, but is now more usually conceded. The system was, however, entirely disused in Europe until (having been completed by the invention of the 0) it was reintroduced through the Arabians (by whom it is called the *Indian notation*), being first systematically explained in the work of Leonardo da Pisa, about 1200. The extension of the system to fractions was accomplished much later. See II.—**Decimal numeration**, any system of naming numbers by taking them in multiples and powers of 10. Such systems have generally prevailed in all languages, being founded on the use of the ten fingers as helps to count.—**Decimal place**, the position of a figure in decimal notation.—**Decimal point**, a dot separating the whole part from the fractional part of an expression in decimal notation. The decimal point appears to have been first used by Napier (*Constructio*, 1619); the writing of it above the line by Newton. See II.—**Decimal system**, any system of measurement or of counting whose units are powers of 10; especially, the metric system (which see, under *metric*).

II. *n.* An expression denoting a decimal fraction by an extension of the decimal notation. A dot, called the *decimal point*, being placed to the right of the units' place, figures are written to the right of it, the first place in passing to the right being appropriated to tenths, the second to hundredths, etc. Thus, 199320.3 is the same as 199320 $\frac{3}{10}$; 19932.03 is the same as 19932 $\frac{3}{100}$; and 1.993203 is the same as 1 $\frac{993203}{1000000}$. (See *decimal fraction*, above.) The invention of decimals is usually attributed to Stevinus (1582). In his notation a mixed number, for example 1993 $\frac{203}{1000}$, which is now written 1993.203, would have been written 199302100(233). The decimal point may be placed above the line (a common practice) or on the line.—**Recurring decimal**, a decimal in which after a certain point the digits are continually repeated. If there is but one recurring figure, the expression is called a *repeating decimal*; if there are more than one, the ex-

pression is called a *circulating decimal*. But these distinctions are not commonly observed with strictness. A circulating decimal is denoted by means of dots over the first and last figures of the recurring period. Thus, $\frac{1}{3} = 0.0135$, that is, 0.0135135135, etc.

2. An approximately horizontal platform or floor extending from side to side of a ship or of a part of a ship, as of a deck-house, and supported by beams and carlines. In wooden ships the decks is formed of planks about three inches wide and three inches thick, spiked to the beams and carlines; in iron ships it is formed of iron plating riveted to the beams and girders and generally covered with wooden planking. An armored deck is protected by iron or steel plating. The spar-deck is the upper deck, of those which extend from stem to stern; the main-deck is the deck immediately below the spar-deck in a double-decked ship; the quarter-deck is that part of the spar-deck which is abaft the mainmast; the topgallant forecastle-deck is a short deck above the spar-deck in the forward part of the ship, generally extending as far aft as the foremast. In a man-of-war the berth-deck is the deck below the gun-deck, where the mess-lockers and -tables are placed, and where the hammocks are slung. The gun-deck is the deck of a man-of-war where the battery is carried; in old line-of-battle ships, where guns were carried on three decks below the spar-deck, they were called respectively the upper, middle, and lower gun-deck. A flush deck is a spar-deck clear from stem to stern of houses or other encumbrances. The term half-deck was formerly applied to the after part of the deck next below the spar-deck, and forward of the cabin bulkhead. The hurricane-deck is the upper light deck of side-wheel passenger-steamers. The orlop-deck is below the berth-deck, and is where the cables were formerly stowed. The poop-deck is the after part of the ship, over the cabin, when the cabin is on the spar-deck. The turtle-deck or turtle-backed deck is so called from its resemblance to the back of a turtle, and is a convex deck extending a short distance aft from the stem of an ocean steamer to shed the water in a head sea; in many iron steamships of recent model there is a similar arrangement on the stern. In river-steamers in the United

States the *boiler-deck* is the deck on which the boilers are carried. A *cambered deck* is a deck arched so as to be higher in the middle than at the stem or stern—the opposite of the usual practice.

the second style of English Pointed architecture, in use from the end of the thirteenth to the beginning of the fifteenth century, when it degenerated into the Perpendicular. It is distinguished from the earlier Pointed style, from which it was developed, by the more flowing lines of its tracery, especially of its windows, by the more intricate and less conventional combinations of its foliage, by the greater elaboration of its capitals, moldings, finials, etc., and generally by a style of ornamentation more naturalistic and as a rule less in accordance with true artistic principles. The *Decorated* style has been divided into two periods: namely, the *Early* or *Geometric Decorated* period, in which the ornament consists especially of simple curves and lines and combinations of them; and the *Decorated* style proper, in which the peculiar characteristics of the style are most emphasized, and meager or involved arrangement of lines in ornament takes the place of the broad treatment of masses which characterizes earlier medieval work.

Decreasing series. See *progression*.—*Syn.* Decrease, Diminish, Diminute, Contract; to lessen, abate, ebb, subside, fall off, fall away, shrink. The first three all mean a becoming less by degrees. *Decrease* more often implies that the causes are imperceptible or not necessarily perceptible, acting, it may be, from within the object itself: as, the swelling decreases daily. *Diminish* generally implies the action of some external cause which is more or less in the mind of those concerned: as, his fortune diminishes daily through extravagance; the troops diminish steadily under disease and conflict. *Decrease* is the appropriate word for reduction of bulk or volume, *diminish* for reduction of number. These distinctions are not always observed. *To diminish* is to become small in size, amount, or number by slow and imperceptible degrees, the reduction being always undesirable and the result a sort of attenuation: as, the army diminished to a few thousands; the child dwindled to a mere skeleton. *To contract* is to become less by shrinkage or a drawing together of parts or elements; it implies loss of size, bulk, or extent, without the loss of constituent substance or parts usually expressed by the other words.

So many wives, who have yet their husbands in their arms; so many parents, who have not the number of their children lessened; so many villages, towns, and cities, whose inhabitants are not decreased, their property violated, or their wealth diminished, are yet owing to the sober conduct and happy results of your advice.

Sw. dekret*, *< L. decretum*, a decree, ordinance, decision, neut. of *decretus*, pp. of *decernere*, decree, decide (*> E. decern*): see *decern*.] 1. E. Schuyler, Amer. Diplomacy, p. 342.

Specifically—2. In *Rom. law*, a determination or judgment of the emperor on a suit between parties. Among the Romans, when all legislative power was centered in the emperor, it was his custom to ask for their opinion and decision in disputes. Their decisions were called decrees, and formed part of the imperial constitutions.

3. An edict or a law made by an ecclesiastical council for regulating business within its jurisdiction. The term is used in ecclesiastical history chiefly as a designation of certain dogmatic and authoritative decisions on disputed points in theology and discipline in the Roman Catholic Church: as, the Decrees of the Council of Trent; the Decree of Auricular Confession by the Fourth Lateran Council.

5. In *theol.*, one of the eternal purposes of God, whereby for his own glory he has foreordained whatsoever comes to pass. Whether these decrees are absolute or conditional—that is, whether they are according to the counsel of his own will, "without any foresight of faith or good works, or any other thing in the creature, as conditions or causes moving him thereto" (*West. Conf. of Faith*, iii.), or are based upon his foreknowledge of the character and course of his free creatures—is a contested question, the Calvinists taking the former view, the Arminians the latter.

By the decree of God for the manifestation of his glory, some men and angels are predestinated unto everlasting life and others foreordained to everlasting death.

West. Conf. of Faith, iii. § 3.

6. The judgment or award of an umpire in a case submitted to him.—**Absolute decree**, a decision that something shall be done with no condition attached to it.—**Berlin decree**, Milan decree, two decrees of Napoleon I. against Great Britain, enforcing his continental system. As a term of logic, it is a translation of Aristotle's ἀναγωγή (translated *deductio* by Boethius), and properly signifies an illative descent from a general principle to the result of that principle in a special case; it is especially used by Aristotle when there is a doubt whether the case truly comes under the principle. By the older logicians it is little used, and not with any exact signification. In modern times it has been chiefly employed by those who hold that all reasoning is either a descent from generals to particulars (*deduction*) or an ascent from particulars to generals (*induction*). See *deductive reasoning*, under *deduction*.

We ought therefore to be fully aware of the modes and degree in which the forms of *deductive reasoning* are affected by the theory of probability, and many persons might be surprised at the results which must be admitted. *Jevons*.

Before *deductive interpretation* of the general truths, there must be some inductive establishment of them. *H. Spencer*, Prin. of Sociol., § 211.

2. Deduced; derived as a conclusion from accepted principles; relating to inference from a principle to the results of that principle in any special case.

He labours to introduce a secondary and *deductive* Atheism: that although men concede there is a God, yet they should deny his providence.

Sir T. Browne, Vulg. Err., i. 10.

Deductive method, in the logical system of J. S. Mill, that mode of investigation by which the law of an effect is ascertained from the consideration of the laws of the different tendencies of which it is the joint result. This method consists of three kinds of operation, the first direct induction, the second ratiocination, the third verification.

To the *deductive method*, thus characterized in its three constituent parts of induction, ratiocination, and verification, the human mind is indebted for its most conspicuous triumphs in the investigation of nature.

Mill, Logic, III. xi. § 6.

Deductive reasoning is commonly opposed to *inductive*, and is meant to include all necessary reasoning (even mathematical induction), together with those probable reasonings which predict results as true in the long run, but excluding those inferences which are regarded as being open to correction in the long run. Thus, if, from counting the letters on a single page, one concludes the proportions of the different letters which will generally be needed in a font of type, the reasoning is *inductive*; but if, knowing what the proportions generally are, one concludes what will be needed in printing a particular book or page, the reasoning is *deductive*.

Deep-sea lead-line, a line used for soundings from 20 to 200 fathoms, marked at every 5 fathoms and used with a lead ranging from 60 to 150 pounds in weight.—**Deep-sea sounding-machine**, the combination of mechanical contrivances by the aid of which soundings may be made to great depths, with a close approach to accuracy. This result has been attained by a combination of improvements, in which great ingenuity has been displayed, and in which the inventive genius of Sir William Thomson has been particularly conspicuous. The principal features of the most perfect sounding-machine are: (1) the sinker, which is a cannon-ball, through which passes a cylinder provided with a valve to collect and retain a specimen of the bottom, the cylinder being, by an ingenious mechanical arrangement, detached from the shot, which remains at the bottom; (2) the line, made of steel wire, weighing about 14½ pounds to the nautical mile; (3) machinery for regulating the lowering of the sinker and for reeling in the wire with the cylinder attached in such a manner that the irregular strain due to the motion of the ship may be guarded against and the danger of breakage thus reduced to a minimum. In the deepest accurate sounding yet made the bottom was reached at the depth of 4,655 fathoms, but owing to the breaking of the wire no specimen was obtained. This sounding was made on the "Tuscarora" by Commander G. E. Belknap, U. S. N., in north latitude 44° 55', east longitude 152° 28'. The deepest sounding yet made in which a specimen of the bottom was brought up was that of the United States Coast Survey steamer "Blake," off Porto Rico, the depth there reached being 4,561 fathoms.

deer (dēr), *n. sing. and pl.* [Early mod. E. also *deere*, and often *dear*, *deare*; < ME. *der, deer*, < AS. *deor*, a wild animal, often in combination, *wild deor, wildeor, wilder* (whence ult. E. *wilderness*, q. v.), = OS. *dier* = OFries. *dier* = D. *dier* = LG. *deer*, *deert* = OHG. *tior*, *MHG. tier*, G. *tier*, *thier* = Icel. *dýr* = Sw. *dýr* = Dan. *dýr* = Goth. *dūs*, a wild animal. Origin uncertain; perhaps orig. an adj., meaning 'wild,' identical with AS. *deor*, bold, brave, vehement, OHG. *tiorlich*, wild. (The AS. *deor*, bold, brave, vehement, was merged later with *deore*, E. *dear*: see *dear*.) Not connected with Gr. *θήρ*, *Æolie* *φῆρ*, a wild beast, or with L. *fērus*, wild, fem. *fēra* (sc. *bestia*), a wild beast (whence ult. E. *fierce*, *ferocious*). The restricted (but not exclusive) use of the word (for *Cervus*) appears in ME., Icel., Sw., Dan., and G. (in hunters' language), and now prevails in mod. E. It is due to the importance of this animal in the chase. Similarly, in Iceland, *dýr* is applied esp. to the fox, as the only beast of prey. In some parts of the United States the horse, as the most important of a general class, is called simply *beast* or *critter* (*creature*); 'a critter company' is a cavalry company (Prov., U. S.).] 1. Any wild quadruped.

But mice, and rats, and such small *deer*,
Have been Tom's food for seven long year. Shak., Lear, iii. 4.

2. The general name of the solid-horned ruminants of the family *Cervidae*, and especially of the genus *Cervus*. See these words. Most of the deer have solid deciduous horns, of the kind called antlers, in the male only; but in the reindeer they are present in both sexes; in the musk-deer (*Moschus*) they are wanting. The largest living deer are the elk of Europe and the moose of America; the smallest are the muntjacs and musk-deer, which are further distinguished by the large tusk-like canine teeth of the males. The term *deer* being so comprehensive, and the animals being so conspicuous, the leading kinds have mostly received distinctive names, as the reindeer, roe-deer, musk-deer, etc. (See these words, and also *brocket*, *elk*, *moose*, *roe*, *stag*, *wapiti*, *caribou*, *black-tail*.) Deer are found solid as far back as the Pliocene period. The best-known extinct species is the Irish elk, *Cervus megalos*. The leading genera of living deer are *Aleas*, *Rangifer*, *Dama*, *Cervus* (with many subgenera), *Capreolus*, *Cervulus*, *Moschus*, and *Hydropotes*. The species are numerous, and are found in most continental parts of the world, excepting southern Africa and Australia. The common deer of the United States is *Cariacus virginianus*. See *Cariacus*.

3. A term loosely applied to the chevrotains, of the family *Tragulidae* (which see), from their resemblance to musk-deer.—**Axis-deer**, *Cervus axis*.—**Barasingha deer**, *Cervus duvaucelli*, of the Himalayas.—**Barbary deer**, *Cervus barbarus*, the only true deer of Africa, found along the Mediterranean coast, from Tunis to the slopes of the Atlas range.—**Cashmere deer**, *Cervus cashemirianus*.—**Fallow-deer**. See *Dama*. The Mesopotamian fallow-deer is *Dama mesopotamica*.—**Formosan deer**, *Cervus taivanus*.—**Gemul deer**, *Pureifer chilensis*.—**Japanese deer**, *Cervus sika*.—**Manchurian deer**, *Cervus manchuricus*.—**Moose-deer**, *Cervus mooseensis*.—**Pampus deer**, *Cariacus campestris*, of South America.—**Panolia deer**, *Cervus eldi*.—**Persian deer**, *Cervus naral*.—**Philippine deer**, *Cervus philippinus*.—**Pudu deer**, *Pudua humilis*, of South America.—**Red deer**, the common stag, *Cervus elaphus*, a native of the forests of Europe and Asia where the climate is temperate. Red deer were in former times very abundant in the forests of England, and were special objects of the chase. They are still plentiful in the Highlands of Scotland, and are taken in rearing them in the deer-parks throughout England. See *stag*.—**Rusa deer**, *Cervus hippelaphus*. See *Rusa*.—**Sambur deer**, *Cervus aristoteli*.—**Spotted deer**. Same as *axis*?, 1.—**Timor deer**, *Cervus timoriensis*. (See also *hog-deer*, *mule-deer*, *water-deer*.)

The color is yellowish brown, darker on the back and paler below. It is generally distributed
